

# Compact Cassette Datasheets

## Denon HD7

I measured MOLs at 11 points from 20 Hz to 1 kHz with a distortion limit of 3%, and measured saturation output levels (SOLs) at nine points from 1 to 16 kHz. I used a Nakamichi 582 deck for substantially all of the record/playback tests. The three Tables list the MOL (3% distortion limit) at 40, 125, and 800 Hz. I selected 40 Hz because it lies in a frequency region important in music for organ and other sources of low-frequency energy. The Tables also present SOL data for 2, 4, and 10 kHz. The SOL curves were very similar in shape, particularly within a tape type. Other data: <https://www.elektronikjk.com>

Maximum Output Level (dB, re: Dolby Level: 200 nWb/m at 400 Hz)

MOL hdi3 = 3%			SOL		
40 Hz	125 Hz	800 Hz	2 kHz	4 kHz	10 kHz
+ 1.9	+ 6.8	+ 6.8	+ 7.7	+ 3.8	-3.8

S/N Ratio (dBA):62.1  
Response Limit (-3 dB) at Dolby Level (kHz):9.4  
Modulation noise (dB):-52.2  
Bias (dB):+ 0.3  
Sensitivity (dB):+2.4
