Caution: CMOS devices have input-static protection, but are susceptible to damage when exposed to extremely high static electrical charges.

The UCN5895A and A5895SLW BiMOS II serial-input, latched source drivers are designed for applications emphasizing low output saturation voltages and currents to -250 mA per output. These smart high-side octal, driver ICs merge an 8-bit CMOS shift register, associated CMOS latches, and CMOS control logic (strobe and output enable) with medium current emitter-follower (sourcing) outputs. Typical applications include incandescent or LED displays (both directly driven and multiplexed), non-impact (i.e., thermal) printers, relays, and solenoids.

Each device is suitable for high-side applications to -250 mA per channel. The maximum supply voltage is 50 V and a minimum output sustaining voltage rating of 35 V for inductive load applications. Under normal operating conditions, the UCN5895A is capable of providing -120 mA (8 outputs continuous and simultaneous) at +65°C with a logic supply of 5 V. Similar devices, with higher output current ratings, are the UCN5890A and UCN5891A.

BiMOS II devices can operate at greatly improved data-input rates. With a 5 V supply, they will typically operate at better than 5 MHz. At 12 V, significantly higher speeds are obtained.

The CMOS inputs provide for minimum loading and are compatible with standard CMOS, PMOS, and NMOS circuits. TTL or DTL circuits may require the use of appropriate pull-up resistors to ensure a proper input-logic high. A CMOS serial data output allows cascading these devices in multiple drive-line applications required by many dot matrix, alphanumeric, and bar graph displays.

These devices are rated for continuous operation over the temperature range of -20°C to +85°C. Because of limitations on package power dissipation, the simultaneous operation of all output drivers may require a reduction in duty cycle. The UCN5895A is supplied in a standard 16-pin dual in-line plastic package with a copper lead frame for increased allowable package power dissipation. The A5895SLW is supplied in a 16-lead wide-body plastic SOIC.

FEATURES

- Low Output-Saturation Voltage
- Source Outputs to 50 V
- Output Current to -250 mA
- To 3.3 MHz Data-Input Rate
- Low-Power CMOS Logic & Latches

Always order by complete part number, e.g., **UCN5895A** .

TIMING CONDITIONS

(V_{DD} = 5.0 V, Logic Levels are V_{DD} and Ground)

A. Minimum Data Active Time Before Clock Pulse (Data Set-Up Time) ..... **75 ns**

B. Minimum Data Active Time After Clock Pulse (Data Hold Time) ..... **75 ns**

C. Minimum Data Pulse Width ..... **150 ns**

D. Minimum Clock Pulse Width ..... **150 ns**

E. Minimum Time Between Clock Activation and Strobe ..... **300 ns**

F. Minimum Strobe Pulse Width ..... **100 ns**

G. Typical Time Between Strobe Activation and Output Transition ..... **1.0 µs**

Serial Data present at the input is transferred to the shift register on the logic “0” to logic “1” transition of the CLOCK input pulse. On succeeding CLOCK pulses, the registers shift data information towards the SERIAL DATA OUTPUT. The SERIAL DATA must appear at the input prior to the rising edge of the CLOCK input waveform.

Information present at any register is transferred to its respective latch when the STROBE is high (serial-to-parallel conversion). The latches will continue to accept new data as long as the STROBE is held high. Applications where the latches are bypassed (STROBE tied high) will require that the OUTPUT ENABLE input be high during serial data entry.

When the OUTPUT ENABLE input is high, all of the output buffers are disabled (OFF) without affecting the information stored in the latches or shift register. With the OUTPUT ENABLE input low, the outputs are controlled by the state of their respective latches.
