# 12-Bit, 800kHz Sampling CMOS
# ANALOG-TO-DIGITAL CONVERTER

**Check for Samples: ADS7810**

## FEATURES

- **1.25μs Throughput Time**
- **Standard ±10V Input Range**
- **69dB Min SINAD With 250kHz Input**
- **±3 LSB Max INL and ±3 LSB Max DNL**
- **Internal Reference**
- **Complete With S/H, REF, CLOCK, ETC.**
- **Parallel Data w/Latches**
- **28-PIN SOIC Package**

## DESCRIPTION

The ADS7810 is a complete 12-bit sampling analog-to-digital converter (A/D) using state-of-the-art CMOS structures. It contains a complete 12-bit capacitor-based SAR A/D with inherent S/H, reference, clock, interface for microprocessor use, and 3-state output drivers.

The ADS7810 is specified at an 800kHz sampling rate, and ensured over the full temperature range. Laser-trimmed scaling resistors provide the industry-standard ±10V input range, while an innovative design allows operation from ±5V supplies.

The 28-pin ADS7810 is available in a plastic SOIC fully specified for operation over the industrial –40°C to +70°C range.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

# ADS7810

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## ORDERING INFORMATION

For the most current package and ordering information, see the Package Option Addendum located at the end of this data sheet, or see the device product folder at www.ti.com.

## ABSOLUTE MAXIMUM RATINGS[1]

Over operating free-air temperature range (unless otherwise noted).

|  | ADS7810 | UNIT |
|---|---|---|
| Analog inputs: $V_{IN}$ | ±25 | V |
|  | $+V_{ANA}$ +0.3 to AGND2 –0.3 | V |
|  | Indefinite Short to AGND2 Momentary Short to $+V_{ANA}$ | V |
| Ground voltage differences: DGND, AGND1, AGND2 | ±0.3 | V |
| $+V_{ANA}$ | +7 | V |
| $+V_{DIG}$ to $+V_{ANA}$ | +0.3 | V |
| $+V_{DIG}$ | +7 | V |
| $-V_{ANA}$ | –7 | V |
| Digital inputs | –0.3 to $+V_{DIG}$ +0.3 | V |
| Maximum junction temperature | +165 | °C |
| Internal power dissipation | 825 | mW |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum rated conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

At $T_A$ = −40°C to +70°C, $f_S$ = 800kHz, $+V_{DIG}$ = $+V_{ANA}$ = +5V, $−V_{ANA}$ = −5V, using internal reference and the 50Ω input resistor shown in Figure 16, unless otherwise specified.

(1)  Shaded cells indicate same specifications as the ADS7810U.
(2)  Typical rms noise at worst-case transitions and temperatures.
(3)  Measured with 50Ω in series with analog input. Adjustable to zero with external potentiometer.
(4)  Full-scale error is the worst case of −Ful-Scale or +Full-Scale untrimmed deviation from ideal first and last code transitions, divided by the transition voltage (not divided by the full-scale range) and includes the effect of offset error.
(5)  All specifications in dB are referred to a full-scale ±10V input.
(6)  Usable bandwidth defined as Full-Scale input frequency at which Signal-to-(Noise+Distortion) degrades to 60dB, or 10 bits of accuracy.
(7)  Recovers to specified performance after 2 x FS input over voltage.

## PIN ASSIGNMENTS

| PIN NO. | PIN NAME | DIGITAL I/O | DESCRIPTION |
|---|---|---|---|
| 1 | $V_{IN}$ | | Analog input. Connect via 50Ω to analog input. Full-scale input range is ±10V. |
| 2 | AGND1 | | Analog ground. Used internally as ground reference point. Minimal current flow. |
| 3 | REF | | Reference input/output. Outputs internal reference of +2.5V nominal. Can also be driven by external system reference. In both cases, decouple to ground with a 0.1μF ceramic capacitor. |
| 4 | CAP | | Reference buffer output. 10μF tantalum capacitor to ground. Nominally +2V. |
| 5 | AGND2 | | Analog ground. |
| 6 | D11 (MSB) | O | Data bit 11. Most significant bit (MSB) of conversion results. Hi-Z state when $\overline{CS}$ is high, or when $R/\overline{C}$ is low, or when a conversion is in progress. |
| 7 | D10 | O | Data bit 10. Hi-Z state when $\overline{CS}$ is high, or when $R/\overline{C}$ is low, or when a conversion is in progress. |
| 8 | D9 | O | Data bit 9. Hi-Z state when $\overline{CS}$ is high, or when $R/\overline{C}$ is low, or when a conversion is in progress. |
| 9 | D8 | O | Data bit 8. Hi-Z state when $\overline{CS}$ is high, or when $R/\overline{C}$ is low, or when a conversion is in progress. |
| 10 | D7 | O | Data bit 7. Hi-Z state when $\overline{CS}$ is high, or when $R/\overline{C}$ is low, or when a conversion is in progress. |
| 11 | D6 | O | Data bit 6. Hi-Z state when $\overline{CS}$ is high, or when $R/\overline{C}$ is low, or when a conversion is in progress. |
| 12 | D5 | O | Data bit 5. Hi-Z state when $\overline{CS}$ is high, or when $R/\overline{C}$ is low, or when a conversion is in progress. |
| 13 | D4 | O | Data bit 4. Hi-Z state when $\overline{CS}$ is high, or when $R/\overline{C}$ is low, or when a conversion is in progress. |
| 14 | DGND | | Digital ground. |
| 15 | D3 | O | Data bit 3. Hi-Z state when $\overline{CS}$ is high, or when $R/\overline{C}$ is low, or when a conversion is in progress. |

## PIN ASSIGNMENTS (continued)

| PIN | | DIGITAL I/O | DESCRIPTION |
|-----|-----|-----|-----|
| NO. | NAME | | |
| 16 | D2 | O | Data bit 2. Hi-Z state when $\overline{CS}$ is high, or when R/$\overline{C}$ is low, or when a conversion is in progress. |
| 17 | D1 | O | Data bit 1. Hi-Z state when $\overline{CS}$ is high, or when R/$\overline{C}$ is low, or when a conversion is in progress. |
| 18 | D0 (LSB) | O | Data bit 0. Least significant bit (LSB) of conversion results. Hi-Z state when $\overline{CS}$ is high, or when R/$\overline{C}$ is low, or when a conversion is in progress. |
| 19 | NC | | Not internally connected. |
| 20 | +V$_{ANA}$ | | Analog positive supply input. Nominally +5V. Connect directly to pins 21, 27, and 28. |
| 21 | +V$_{DIG}$ | | Digital supply input. Nominally +5V. Connect directly to pins 20, 27, and 28. |
| 22 | DGND | | Digital ground. |
| 23 | R/$\overline{C}$ | I | Read/Convert input. With $\overline{CS}$ low, a falling edge on R/$\overline{C}$ puts the internal sample/hold into the hold state and starts a conversion. With $\overline{CS}$ low and no conversion in progress, a rising edge on R/$\overline{C}$ enables the output data bits. |
| 24 | $\overline{CS}$ | I | Chip select. With R/$\overline{C}$ low, a falling edge on $\overline{CS}$ will initiate a conversion. With R/$\overline{C}$ high and no conversion in progress, a falling edge on $\overline{CS}$ will enable the output data bits. |
| 25 | $\overline{BUSY}$ | O | Busy output. Falls when a conversion is started, and remains low until the conversion is completed and the data are latched into the output register. With $\overline{CS}$ low and R/$\overline{C}$ high, output data will be valid when $\overline{BUSY}$ rises, so that the rising edge can be used to latch the data. |
| 26 | −V$_{ANA}$ | | Analog negative supply input. Nominally −5V. Decouple to ground with 0.1µF ceramic and 10vF tantalum capacitors. |
| 27 | +V$_{DIG}$ | | Digital supply input. Nominally +5V. Connect directly to pins 20, 21, and 28. |
| 28 | +V$_{ANA}$ | | Analog positive supply input. Nominally +5V. Connect directly to pins 20, 21, and 27, and decouple to ground with 0.1µF ceramic and 10µF tantalum capacitors. |

## APPLICATION INFORMATION

### BASIC OPERATION

Figure 14 shows a basic circuit to operate the ADS7810. Taking R/$\overline{C}$ (pin 23) low for a minimum of 40ns will initiate a conversion. $\overline{BUSY}$ (pin 25) will go low and stay low until the conversion is completed and the output registers are updated. Data will be output in binary twos complement with the MSB on D11 (pin 6). $\overline{BUSY}$ going high can be used to latch the data. All convert commands will be ignored while $\overline{BUSY}$ is low.

The ADS7810 will begin tracking the input signal at the end of the conversion. Allowing 1.25µs between convert commands assures accurate acquisition of a new signal.

### STARTING A CONVERSION

The combination of $\overline{CS}$ (pin 24) and R/$\overline{C}$ (pin 23) low for a minimum of 40ns puts the sample/hold of the ADS7810 in the hold state and starts a conversion. $\overline{BUSY}$ (pin 25) will go low and stay low until the conversion is completed and the internal output register has been updated. All new convert commands during $\overline{BUSY}$ low will be ignored.

The ADS7810 will begin tracking the input signal at the end of the conversion. Allowing 1.25µs between convert commands assures accurate acquisition of a new signal. Refer to Table 1 for a summary of $\overline{CS}$, R/C, and $\overline{BUSY}$ states, and Figure 1 and Figure 2 for timing parameters.

$\overline{CS}$ and R/$\overline{C}$ are internally OR'd and level triggered. There is not a requirement which input goes low first when initiating a conversion. If it is critical that $\overline{CS}$ or R/$\overline{C}$ initiate the conversion, be sure the less critical input is low at least 10ns prior to the initiating input.

To reduce the number of control pins, $\overline{CS}$ can be tied low using R/$\overline{C}$ to control the read and convert modes. Note that the parallel output will be active whenever R/$\overline{C}$ is HIGH and no conversion is in progress. See the *Reading Data* section and refer to Table 1 for control line functions for 'read' and 'convert' modes.

**Figure 14.  Basic Operation**

Product Folder Link(s): *ADS7810*

## READING DATA

The ADS7810 outputs full parallel data in binary twos complement data format. The parallel output will be active when R/$\overline{C}$ (pin 23) is high, $\overline{CS}$ (pin 24) is low, and no conversion is in progress. Any other combination will 3-state the parallel output. Valid conversion data can be read in a full parallel, 12-bit word on D11-D0 (pins 6-13 and 15- 18). Refer to Table 2 for ideal output codes.

After the conversion is completed and the output registers have been updated, $\overline{BUSY}$ (pin 25) will go high. Valid data from the most recent conversion will be available on D11-D0 (pins 6-13 and 15-18). $\overline{BUSY}$ going high can be used to latch the data. Refer to Timing Requirements as well as Figure 1 and Figure 2.

**NOTE:** For the best performance, the external data bus connected to D11-D0 should not be active during a conversion. The switching noise of the external asynchronous data signals can cause digital feedthrough degrading the converter performance.

The number of control lines can be reduced by tying $\overline{CS}$ low while using R/$\overline{C}$ to initiate conversions and activate the output mode of the converter. See Figure 1.

## INPUT RANGES

The ADS7810 offers a standard ±10V input range. Figure 15 and Figure 16 show the necessary circuit connections for the ADS7810 with and without external trim. Offset and full-scale error[1] specifications are tested and ensured with the 50Ω resistor shown in Figure 16. This external resistor makes it possible to trim the offset ±50mV using a trim pot or trim DAC. This resistor may be left out if the offset and gain errors will be corrected in software or if they are negligible in regards to the particular application. See the *Calibration* section of the data sheet for details.

The nominal input impedance of 3.125kW results from the combination of the internal resistor network shown on the front page of the product data sheet and external 50Ω resistor. The input resistor divider network provides inherent overvoltage protection ensured to at least ±25V. The 50Ω, 1% resistor does not compromise the accuracy or drift of the converter. It has little influence relative to the internal resistors, and tighter tolerances are not required.

**NOTE:** The values shown for the internal resistors are for reference only. The exact values can vary by ±30%. This is true of all resistors internal to the ADS7810. Each resistive divider is trimmed so that the proper division is achieved.

(1) Full-scale error includes offset and gain errors measured at both +FS and −FS.

Note:    Use 1% metal film resistors. Trim offset at
          0V first, then trim gain at 10V.

### Table 1. Control Line Functions for 'Read' and 'Convert'

| $\overline{CS}$ | R/$\overline{C}$ | $\overline{BUSY}$ | OPERATION |
|---|---|---|---|
| 1 | X | X | None. Databus in Hi-Z state. |
| ↓ | 0 | 1 | Initiates conversion. Databus remains in Hi-Z state. |
| 0 | ↓ | 1 | Initiates conversion. Databus enters Hi-Z state. |
| 0 | 1 | ↑ | Conversion completed. Valid data from the most recent conversion on the databus. |
| ↓ | 1 | 1 | Enables databus with valid data from the most recent conversion. |
| ↓ | 1 | 0 | Conversion in progress. Databus in Hi-Z state, enabled when the conversion is completed. |
| 0 | ↑ | 0 | Conversion in progress. Databus in Hi-Z state, enabled when the conversion is completed. |
| 0 | 0 | ↑ | Conversion completed. Valid data from the most recent conversion in the output register, but output pins D11-D0 are 3-stated. |
| X | X | 0 | New convert commands ignored. Conversion in progress. |

### Table 2. Ideal Input Voltages and Output Codes

| DESCRIPTION | ANALOG VALUE | DIGITAL OUTPUT | |
|---|---|---|---|
| Full-Scale Range | ±10V | BINARY TWOS COMPLEMENT | |
| Least Significant Bit (LSB) | 4.88mV | BINARY CODE | HEX CODE |
| +Full-Scale (10V − 1LSB) | 9.995V | 0111 1111 1111 | 7FF |
| Midscale | 0V | 0000 0000 0000 | 000 |
| One LSB below Midscale | −4.88mV | 1111 1111 1111 | FFF |
| −Full-Scale | −10V | 1000 0000 0000 | 800 |

## CALIBRATION

The ADS7810 can be trimmed in hardware or software. The offset should be trimmed before the gain since the offset directly affects the gain.

### Hardware Calibration

To calibrate the offset and gain of the ADS7810, install the proper resistors and potentiometers as shown in Figure 15. The calibration range is ±50mV for bipolar zero and ±120mV for full scale.

Potentiometer $P_1$ and resistor $R_1$ form the offset adjust circuit and $P_2$ and $R_2$ the gain adjust circuit. The exact values are not critical. $R_1$ and $R_2$ should not be made any larger than the value shown. They can easily be made smaller to provide increased adjustment range. Reducing these below 15% of the indicated values could begin to adversely affect the operation of the converter.

$P_1$ and $P_2$ can also be made larger to reduce power dissipation. However, larger resistances will push the useful adjustment range to the edges of the potentiometer. $P_1$ should probably not exceed 20kΩ and $P_2$ 100kΩ in order to maintain reasonable sensitivity.

### Software Calibration

To calibrate the offset and gain of the ADS7810, no external resistors are required. See the *No Calibration* section for details on the effects of the external resistor.

### No Calibration

See Figure 16 for circuit connections. Note that the actual voltage dropped across the 50Ω resistor is nearly two orders of magnitude lower than the voltage dropped across the internal resistor divider network. This should be taken into consideration when choosing the accuracy and drift specifications of the external resistors. In most applications, 1% metal-film resistors will be sufficient.

The external 50Ω resistor shown in Figure 16 may not be necessary in some applications. This resistor provides trim capability for the offset and compensates for a slight gain adjustment internal to the ADS7810. Not using the 50Ω resistor will cause a small gain error but will have no effect on the inherent offset error. Figure 17 shows typical transfer function characteristics with and without the 50Ω resistor in the circuit.

## REFERENCE

The ADS7810 can operate with its internal 2.5V reference or an external reference. By applying an external reference to pin 3, the internal reference can be bypassed. The reference voltage at REF is buffered internally and output on CAP (pin 4).

### REF

REF (pin 3) is an input for an external reference or the output for the internal 2.5V reference. A 0.1μF capacitor should be connected as close to the REF pin as possible. The capacitor and the output resistance of REF create a low pass filter to band limit noise on the reference. Using a smaller value capacitor will introduce more noise to the reference degrading the SNR and SINAD. The internal reference should not be used to sink or source currents greater than 100mA. In addition, all external loads should be static.

The range for the external reference is 2.3V to 2.7V and determines the actual LSB size. Increasing the reference voltage will increase the full-scale range and the LSB size of the converter which can improve the SNR.

**Figure 17.  Comparison of the ADS7810 Transfer Function with and without the 50Ω Series Resistor on V$_{IN}$**

Product Folder Link(s): *ADS7810*

## CAP

CAP (pin 4) is the output of the internal reference buffer. A 10μF tantalum capacitor should be placed as close to the CAP as possible to provide optimum switching currents for the CDAC throughout the conversion cycle and compensation for the output of the buffer. Using a capacitor any smaller than 1μF can cause the output buffer to oscillate and may not have sufficient charge for the CDAC. Capacitor values larger than 10μF will have little effect on improving performance. The voltage on the CAP pin is approximately 2V when using the internal reference, or 80% of an externally supplied reference.

## LAYOUT

### POWER

The ADS7810 uses the majority of its power for analog and static circuitry, and it should be considered as an analog component. For optimum performance, tie the analog and digital +5V power pins to the same +5V power supply and tie the analog and digital grounds together.

For best performance, the ±5V supplies can be produced from whatever analog supply is used for the rest of the analog signal conditioning. If ±12V or ±15V supplies are present, simple regulators can be used. The +5V power for the A/D should be separate from the +5V used for the system's digital logic. Connecting +$V_{DIG}$ (pin 27) directly to a digital supply can reduce converter performance due to switching noise from the digital logic.

Although it is not suggested, if the digital supply must be used to power the converter, be sure to properly filter the supply. Either using a filtered digital supply or a regulated analog supply, both $V_{DIG}$ and $V_{ANA}$ should be tied to the same +5V source.

### GROUNDING

Three ground pins are present on the ADS7810. DGND (pin 22) is the digital supply ground. AGND2 (pin 5) is the analog supply ground. AGND1 (pin 2) is the ground which all analog signals internal to the A/D are referenced. AGND1 is more susceptible to current induced voltage drops and must have the path of least resistance back to the power supply.

All the ground pins of the ADS should be tied to the analog ground plane, separated from the system digital logic ground, to achieve optimum performance.

Both analog and digital ground planes should be tied to the *system* ground as near to the power supplies as possible. This helps to prevent dynamic digital ground currents from modulating the analog ground through a common impedance to power ground.

### SIGNAL CONDITIONING

The FET switches used for the sample hold on many CMOS A/D converters release a significant amount of charge injection which can cause the driving op amp to oscillate. The resistive front end of the ADS7810 attenuates this charge and reduces its magnitude significantly—reducing the burden on the external input amplifier or buffer.

However, keep in mind that maintaining signal integrity at voltage swings of ±10V and frequencies of several hundred kilohertz is extremely challenging. In addition, the external input amplifier must drive the ADS7810 mainly during its sample period—roughly 200ns. This will require a highspeed, precision amplifier which can swing to greater than ±10V.

For signals where the predominant frequencies are below 200kHz, the OPA671 operational amplifier should be adequate for most applications. In some cases or where input frequencies are higher, a composite configuration of the OPA671 and BUF634 (in its wide bandwidth mode) may be the best choice. See the BUF634 data sheet for more information.

The resistive front end of the ADS7810 also provides an ensured ±25V over voltage protection. In most cases, this eliminates the need for external input protection circuitry.

### INTERMEDIATE LATCHES

The ADS7810 does have 3-state outputs for the parallel port, but intermediate latches should be used if the bus will be active during conversions. If the bus is not active during conversions, the 3-state outputs can be used to isolate the A/D from other peripherals on the same bus.

Intermediate latches are beneficial on any monolithic A/D converter. The ADS7810 has an internal LSB size of 610mV. Transients from fast switching signals on the parallel port, even when the A/D is 3-stated, can be coupled through the substrate to the analog circuitry causing degradation of converter performance.

# REVISION HISTORY

## PACKAGING INFORMATION

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish | MSL Peak Temp (3) | Op Temp (°C) | Top-Side Markings (4) | Samples |
|---|---|---|---|---|---|---|---|---|---|---|---|
| ADS7810U | NRND | SOIC | DW | 28 | 20 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-3-260C-168 HR | -40 to 85 | ADS7810U B | |
| ADS7810UB | NRND | SOIC | DW | 28 | 20 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-3-260C-168 HR | -40 to 85 | ADS7810U B | |
| ADS7810UBE4 | NRND | SOIC | DW | 28 | 20 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-3-260C-168 HR | -40 to 85 | ADS7810U B | |
| ADS7810UE4 | NRND | SOIC | DW | 28 | 20 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-3-260C-168 HR | -40 to 85 | ADS7810U B | |

**(1)** The marketing status values are defined as follows:
**ACTIVE:** Product device recommended for new designs.
**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.
**OBSOLETE:** TI has discontinued the production of the device.

**(2)** Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
**TBD:** The Pb-Free/Green conversion plan has not been defined.
**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

**(3)** MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**(4)** Only one of markings shown within the brackets will appear on the physical device.
