## ■ Usage Notes

1. Be sure to use  $SV_{CC}$  in the maximum potential.  
Otherwise, it is likely to cause an operating error.
2. On driver gain setting,  
Power amp. voltage gain: 23 dB

3. On operating mode of mute,

- 1) Driver

	PC1		PC2	
	High	Low (open)	High	Low (open)
Channel 1	Active	Mute	—	—
Channel 2	—	—	Active	Mute

- 2) General-use op-amp.

	PC1	
	High	Low (open)
PC2	High	Active
	Low (open)	Active

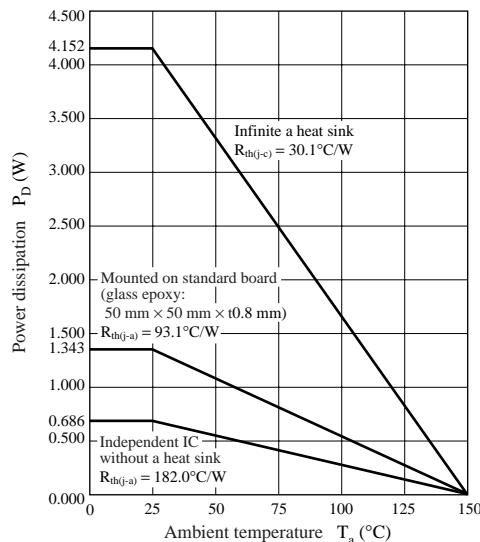

4. Appropriate care should be taken on the characteristics.

When changing an external circuit constant on actual use, secure an appropriate margin in consideration of characteristic fluctuation of external parts and our ICs including transient characteristics as well as static ones.

5. Avoid the short-circuits between output pin and  $V_{CC}$ , output pin and GND (line-to-supply and line-to-ground), and between output pins (load short-circuit). Otherwise, the IC is likely to emit smoke and break down.
6. An appropriate prior study should be done for use of dip soldering.
