

## Motor driver ICs

# 3V electronic governor BA6235F

The BA6235 and BA6235F are ICs for controlling the speed of low voltage DC motors. They consist of a reference voltage generator, current multiplier, and DC amplifier. The speed of DC motor is controlled by detecting the counter-electromotive force generated by the motor. Various DC motors can be driven by changing the external CR time constants.

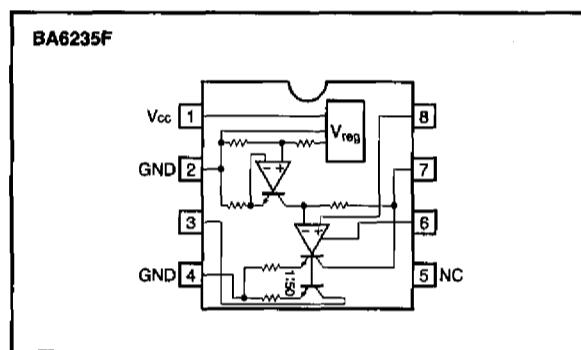

### ●Applications

3V radio cassette tape recorders  
Micro-cassette tape recorders

### ●Features

- 1) Wide range of operating voltage. (1.8~5V)
- 2) Low current consumption. ( $I_{\text{Q}}=2.0\text{mA}$ )
- 3) Various DC motors can be driven by changing the external CR time constants.
