CD4042BM/CD4042BC Quad Clocked D Latch

General Description

The CD4042BM/CD4042BC quad clocked "D" latch is a monolithic complementary MOS (CMOS) integrated circuit constructed with P- and N-channel enhancement mode transistors. The outputs Q and $\overline{Q}$ either latch or follow the data input depending on the clock level which is programmed by the polarity input. For polarity = 0; the information present at the data input is transferred to Q and $\overline{Q}$ during 0 clock level; and for polarity = 1, the transfer occurs during the 1 clock level. When a clock transition occurs (positive for polarity = 0 and negative for polarity = 1), the information present at the input during the clock transition is retained at the outputs until an opposite clock transition occurs.

Features

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The tables of "Recommended Operating Conditions" and "Electrical Characteristics" provide conditions for actual device operation.

Note 2: V_{SS} = 0V unless otherwise specified.

Note 3: Being a latch, the CD4042BM/CD4042BC is not clock rise and fall time sensitive.
