

Dolby* B-C Type Noise Reduction System with Playback Equalizer Amplifier**Description**

The CXA2561Q is an IC designed for use in car stereo cassette decks. Functions include Dolby B-C type noise reduction (NR) system, playback equalizer amplifier and music sensor into a single chip.

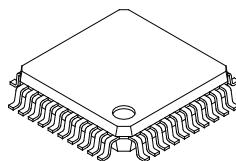

Features

- Few external parts
- Small package (40-pin QFP)
- Same pin configuration as for the Dolby B type NR system (CXA2560Q) and no Dolby NR system (CXA2559Q)
- Dolby B-C type NR and playback equalizer amplifier into a single chip
- FORWARD/REVERSE head select switch
- Mute function
- Music signal interval detection level can be set by the external resistors/capacitors (2 modes).
- High-frequency cut-off of the music sensor circuit can be adjusted by the external capacitance.

Applications

- Car stereo cassette decks
- Playback-only cassette decks

40 pin QFP (Plastic)

**Structure**

Bipolar silicon monolithic IC

Absolute Maximum Ratings

| | | | |

Electrical Characteristics Measurement Circuit

Application Circuit

Application circuits shown are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party patent and other right due to same.

Description of Operation

1. Signal route

The CXA2561Q signal circuit is shown in Fig. 1.

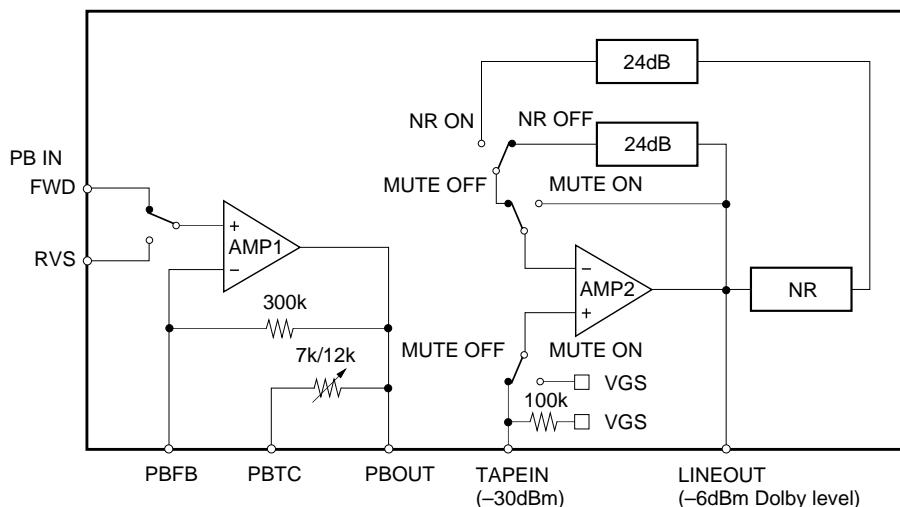

Fig. 1. Signal route block diagram

2. Gain adjustment method

Adjust the playback equalizer amplifier gain so that -6dBm (Dolby level) is output on LINEOUT (Pins 7 and 24) by playing back the reference tape for Dolby level adjustment.

Adjustment should be performed according to the rules of Dolby Laboratories Corporation because this IC has the built-in Dolby NR system.

Dolby level is defined as 200nWb/m measured according to the ANSI high efficiency head method.

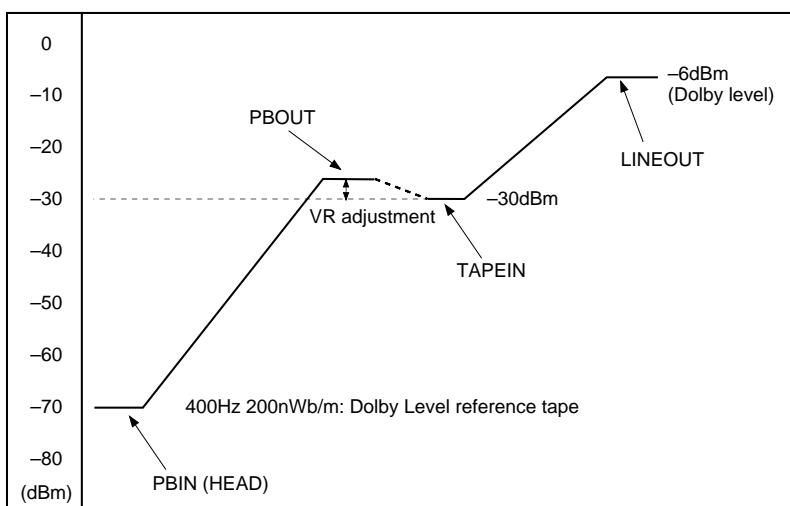

Fig. 2. Level diagram

Use the following reference tapes specified by Dolby Laboratories Corporation.

1. A-bex Laboratories, Inc.
(part no. TCC-130)
2. BASF (product code 09797 XE)
3. Kaneon Corp.
(LC Engineering part no. LCT-7001)
4. Standard Tape Laboratory
(catalogue no. 28)
5. TEAC Corporation, Japan
(part no. MTT150)
6. TEAC Corporation of America
(part no. MTT150)
7. Victor Company of Japan, Ltd.
(part no. TMT-6130, VTT-727)
8. Sony Corporation (part no. TY-256)

3. Playback equalizer amplifier

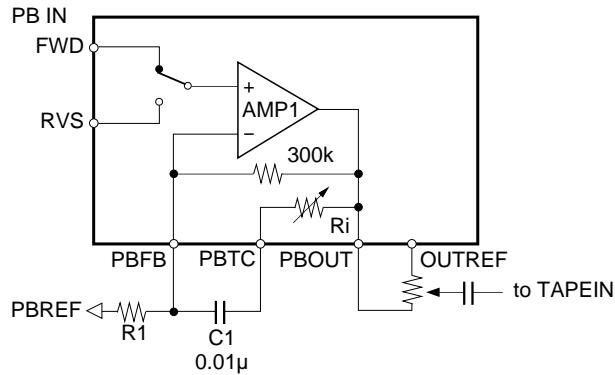

Fig. 3. Playback equalizer amplifier block diagram

The CXA2561Q configures the playback equalizer amplifier by connecting the external capacitor C1 and resistor R1 shown in Fig. 3.

Two systems (FORWARD and REVERSE) of playback head input are provided for each channel.

The FORWARD input pin is selected when DRSW (Pin 19) is Low; REVERSE is selected when DRSW is High.

The playback equalizer amplifier frequency response can be set in two levels (70μs/ 120μs).

When TAPESW (Pin 18) is Low, Ri is 7kΩ; when TAPESW is High, Ri is 12kΩ.

The gain can be adjusted by connecting VR between POUT (Pins 2 and 29) and OUTREF (Pins 3 and 28); or by using VR for the external R1.

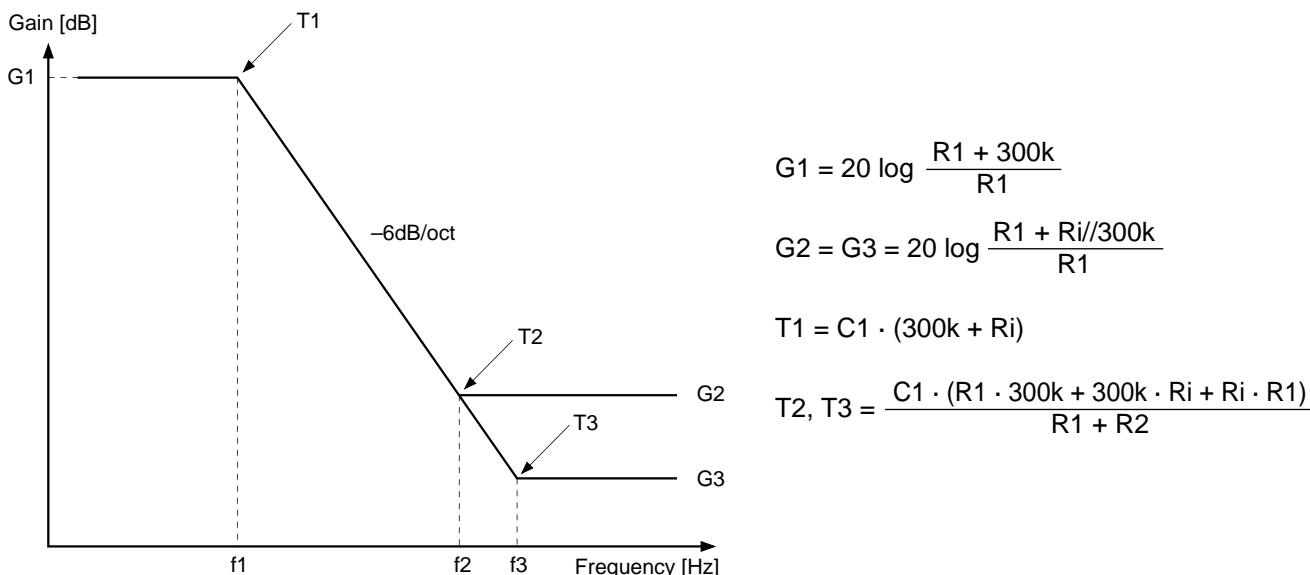

Fig. 4. Playback equalizer amplifier frequency response

4. Music sensor

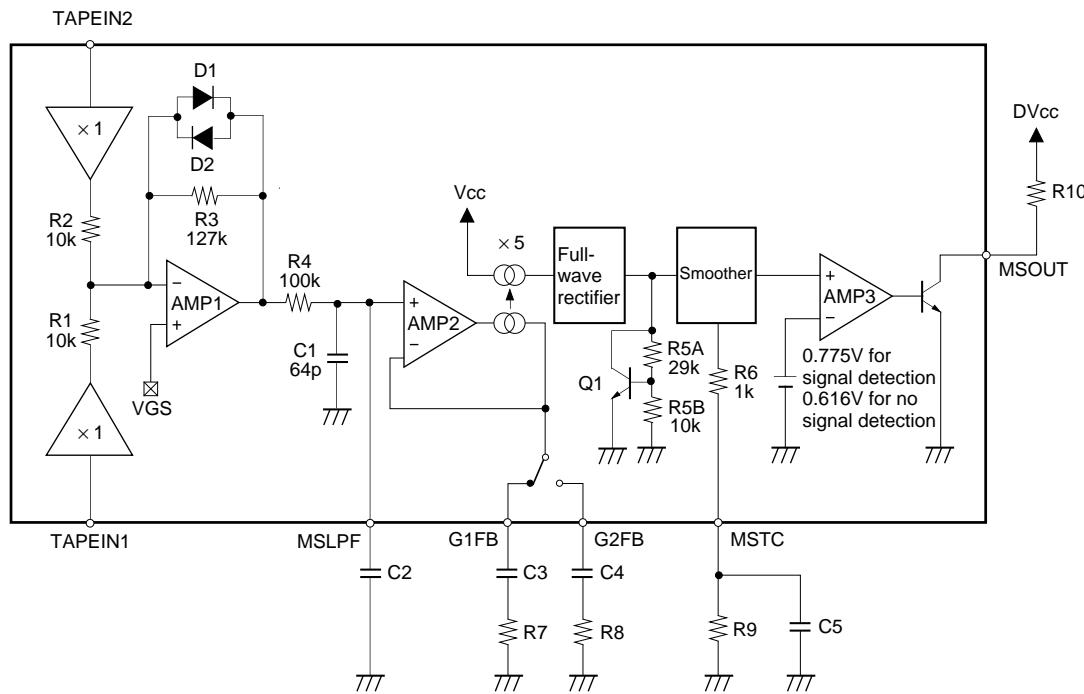

Fig. 5. Music sensor block diagram

(1) Adjustment of music signal detection level

Adjustment the external resistors R7 and R8 to adjust the music signal interval detection level.

The signal detection level v1 and no signal detection level v2 are expressed by the following equations.

$$v1 = -39 + 20\log(39k/Rext) \text{ [dBm]} \quad Rext: R7 \text{ or } R8$$

$$v2 = v1 - 2 \text{ [dBm]}$$

(2) Low-frequency cut-off adjustment of music sensor

Adjust the external resistors R7, R8 and the external capacitors C3, C4 to adjust the low-frequency cut-off.

The low-frequency cut-off is expressed by the following equation.

$$fc1 = 1 / (2\pi \cdot Cext \cdot Rext) \quad Cext, Rext: C3, R7 \text{ or } C4, R8$$

(3) High-frequency cut-off adjustment of music sensor

Adjust the capacitor C2 to MSLPF (Pin 10) to adjust the high-frequency cut-off. The high-frequency cut-off is expressed by the following equation.

$$fc2 = 1 / (2\pi \cdot (64p + C2) \cdot 100k)$$

The high-frequency cut-off is approximately 25kHz when MSLPF is left open.

(4) Response time adjustment

Adjust the external resistor R9 and the external capacitor C5 to adjust the response time.

The response time for signal detection depends on the internal resistor R6 and the external capacitor C5.

The response time for no signal detection depends on the external resistor R9 and the external capacitor C5.

5. Operating mode control method

The CXA2561Q has a Dolby NR mode select switch (NRMODE), Dolby NR switch (NRSW), mute switch (MUTE SW), playback equalizer amplifier select switch (TAPESW), head input select switch (DRSW), music sensor mode select switch (MSMODE) and music sensor switch (MSSW).

The operating modes for each switch are shown in the following table.

| Pin No. | Pin name | Pin voltage | |
|---------|----------|-----------------|-----------------|
| | | Low (OPEN) | High |
| 15 | NRMODE | Dolby B type NR | Dolby C type NR |
| 16 | NRSW | Dolby NR OFF | Dolby NR ON |
| 17 | MUTESW | MUTE OFF | MUTE ON |
| 18 | TAPESW | 70μs | 120μs |
| 19 | DRSW | PBIN FORWARD | PBIN REVERSE |
| 20 | MSMODE | G1 | G2 |
| 21 | MSSW | MS ON | MS OFF |

Notes on Operation

1. DIREF pin resistance

The current on DIREF (Pin 25) is the reference for the Dolby NR static characteristic, playback equalizer amplifier resistor 7kΩ/12kΩ and the comparator threshold value of the music sensor.

Use the resistor with high accuracy for connecting to the DIREF pin.

(The resistance accuracy of 2% <metal-oxide> is recommended.)

2. Dolby NR

The Dolby NR attack/recovery time is determined by the capacitance connected to TCH (Pins 8 and 23), and TCL (Pin 9 and 22).

Use the parts, connected to these pins, with high accuracy and small temperature characteristics.

(The capacitance accuracy of 10% <film> is recommended.)

3. Playback equalizer amplifier

The playback equalizer amplifier characteristics are determined by the resistor connected between the IC internal resistor and PBFB (Pins 31 and 40) and the capacitor connected between PBFB and PBTC (Pins 1 and 30). Use the parts which satisfies the accuracy required for the playback equalizer amplifier.

4. Music sensor

The resistance and capacitance connected to G2FB (Pin 11) and G1FB (Pin 12) determine the detection level and high-frequency cut-off.

The response time is determined by the resistance and capacitance connected to MSTC (Pin 13).

Use the parts which satisfies the accuracy required for the music sensor.
