Functional Description

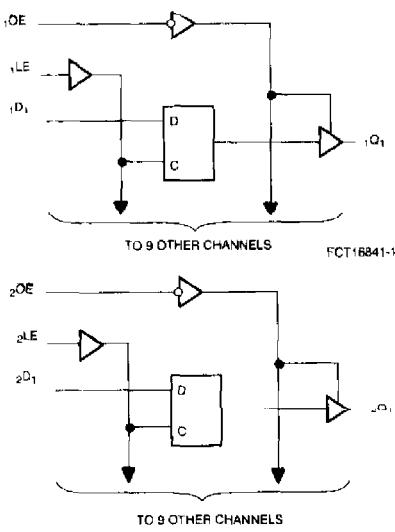

The CY74FCT16841T and CY74FCT162841T are 20-bit D type latches designed for use in bus applications requiring high speed and low power. These devices can be used as two inde-

pendent 10-bit latches, or as a single 10-bit latch, or as a single 20-bit latch by connecting the Output Enable (OE) and Latch (LE) inputs. Flow-through pinout and small shrink packaging aid in simplifying board layout. The output buffers are designed with a power-off disable feature to allow live insertion of boards.

The CY74FCT16841T is ideally suited for driving high-capacitance loads and low-impedance backplanes.

The CY74FCT162841T has 24-mA balanced output drivers with current limiting resistors in the outputs. This reduces the need for external terminating resistors and provides for minimal undershoot and reduced ground bounce. The CY74FCT162841T is ideal for driving transmission lines.

Notes:

1. H = HIGH Voltage Level.
2. Output level before L1: HIGH-to-LOW Transition.
3. Operation beyond the limits set forth may impair the useful life of the device. Unless otherwise noted, these limits are over the operating free-air temperature range.
4. Unused inputs must always be connected to an appropriate logic voltage level, preferably either V_{CC} or ground.
5. Typical values are at V_{CC}=5.0V, T_A=+25°C ambient.
6. This parameter is guaranteed but not tested.
7. Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high-speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parametric tests. In any sequence of parameter tests, I_{OS} tests should be performed last.

- 8. Per TTL driven input (V_{IN}=3.4V); all other inputs at V_{CC} or GND.
- 9. This parameter is not directly testable, but is derived for use in Total Power Supply calculations.
- 10. $I_C = I_{CC} + I_{INPUTS} + I_{DYNAMIC}$
 $I_{CC} = I_{CC}(1.8I_{CD}Df_1N^2 + I_{CD}(6/2 + f_1N^2))$
 $I_{CC} = \text{Quiescent Current with CMOS input levels}$
 $\Delta I_{CC} = \text{Power Supply Current for a TTL HIGH input}$
 $(V_{IN}=3.4V)$
 $D_f_1 = \text{Duty Cycle for TTL inputs HIGH}$
- 11. Values for these conditions are examples of the I_{CC} formula. These limits are guaranteed but not tested.
