DM9318 Priority Encoders

General Description

These TTL encoders feature priority decoding of the input data to ensure that only the highest-order data line is encoded. All inputs are buffered to represent one normalized Series 54/74 load. The DM9318 and DM8318 encode eight data lines to three-line (4-2-1) binary (octal). Cascading circuitry (enable input E1 and enable output E0) has been provided to allow octal expansion without the need for external circuitry. For all types, data inputs and outputs are active at the low logic level.

Features

- Pin for pin with popular DM54148/74148
- Encodes 8 data lines to 3-line binary (octal)

TL/F/6607-1

- Applications include: N-bit encoding Code converters and generators
- Typical data delay 10 ns
- Typical power dissipation 190 mW

Commercial	0°C to +70°C
Storage Temperature Range	-65°C to +150°C

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
