DESCRIPTION

The DS12887A Real Time Clock plus RAM is designed to be a direct replacement for the DS1287A. The DS12887A is identical in form, fit, and function to the DS1287A, and has an additional 64 bytes of general purpose RAM. Access to this additional RAM space is determined by the logic level presented on AD6 during the address portion of an access cycle. The $\overline{\text{RCLR}}$ pin is used to clear (set to logic 1) all 114 bytes of general purpose RAM but does not affect the RAM associated with the real time clock. In order

to clear the RAM, $\overline{\text{RCLR}}$ must be forced to an input logic "0" (-0.3 to +0.8 volts) during battery back-up mode when V cc is not applied.

The RCLR function is designed to be used via human interface (shorting to ground manually or by switch) and not to be driven with external buffers. All other operation, description and specification is identical to the DS12887.
