## PRECAUTION FOR USE AND APPLICATION

### 1) Input Stage

The input stage of power amplifier (Equivalent circuit) is comprised of a PNP differential pair (Q2 and Q3) preceded by a PNP emitter follower (Q1) which allows DC referencing of the source signal to ground.

This eliminates the need for an input coupling capacitor. However, in case the brush noise of volume becomes a problem, provide serially a coupling capacitor to the input side.

### 2) Adjustment of Voltage Gain

The voltage gain is fixed at  $G_V=40\text{dB}$  by the resistors (R4 and R5) in IC, however, its reduction is possible through adding  $R_f$  as shown in Fig 2. In this case, the voltage gain is obtained by the following Equation.

$$G_V = 20 \log \frac{R_5 + R_4 + R_f}{R_4 + R_f}$$

It is recommended to use this IC with the voltage gain of  $G_V=28\text{dB}$  or over.

### 3) Ripple Rejection Ratio

Adding  $C_{RIP}$ , to terminal 2 as shown Fig 3, the Ripple Rejection ratio is improved from -25dB Typ. to -45dB Typ.. (in case of  $C_{RIP}=100\mu\text{F}$ ). Refer to R.R. vs. f characteristics.
