

## DUAL POWER OPERATIONAL AMPLIFIERS

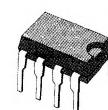

- OUTPUT CURRENT TO 1A
- OPERATES AT LOW VOLTAGES
- SINGLE OR SPLIT SUPPLY
- LARGE COMMON-MODE AND DIFFERENTIAL MODE RANGE
- GROUND COMPATIBLE INPUTS
- LOW SATURATION VOLTAGE
- THERMAL SHUTDOWN

The L272 and L272M are monolithic integrated circuits in powerdip and minidip packages intended for use as power operational amplifiers in a wide range of applications including servo amplifiers and power supplies, compact disc, VCR, etc.

The high gain and high output power capability provide superior performance whatever an operational amplifier/power booster combination is required.

## APPLICATION SUGGESTION

### NOTE

In order to avoid possible instability occurring into final stage the usual suggestions for the linear power stages are useful, as for instance:

- layout accuracy;

- A 100nF capacitor connected between supply pins and ground;
- boucherot cell (0.1 to  $0.2\mu F$  +  $1\Omega$  series) between outputs and ground or across the load.

Note: The input voltage level is compatible with L291 (5-BIT D/A converter)

Fig. 13 – Bidirectional speed control of DC motors.

For circuit stability ensure that  $R_X > \frac{2R_3 \circ R_1}{R_M}$  where  $R_M$  = internal resistance of motor. The voltage available at the terminals of the motor is  $V_M = 2(V_i - \frac{V_s}{2}) + |R_o|I_M$  where  $|R_o| = \frac{2R_3 \circ R_1}{R_X}$  and  $I_M$  is the motor current.
