## Video Signal Processing IC for VHS VCR Systems

### Overview

The LA7440, 7440M is a video signal processing single-chip IC that, except for the VHS format VCR SECAM chrominance signal, handles the PAL-G, B, I M and N, NTSC-M, 4.43 NTSC, MESECAM and NAP-G, B, I, M and N formats. IC internal trimming is used to make the LA7440, 7440M is completely adjustment free, and in combination with a special-purpose CCD (the LC89971, 89971M) it provides a significant reduction in external components, including the glass delay line. Thus the LA7440, 7440M can significantly reduce the signal processing board manufacturing costs. Furthermore, the LA7440, 7440M supports the NAP format (NTSC to PAL conversion) that is poised to become widespread in Europe, China and other markets.

### Features

- Completely adjustment free
 

The AGC, carrier, deviation, and PB-Y level are adjustment free.  
The YC record current can also be made adjustment free by using the LA7411, 7416 as the head amplifier.
- Support for NAP and PAL color array correction
 

Full modulation using a balanced modulator allows playback and conversion to PAL format of NTSC signals recorded on tape.
- Crosstalk exclusion in combination with a special-purpose CCD
 

Crosstalk can be excluded without using a glass delay line by combining the LA7440, 7440M with a special-purpose CCD (the LC89971, 89971M).
- Minimal number of external components
 

New built-in components:

  - Detail enhancer CR
  - C-trap in the Y low-pass filter
  - Crystal selector switch
  - Playback C low-pass filter

- High performance and multiple functions
 

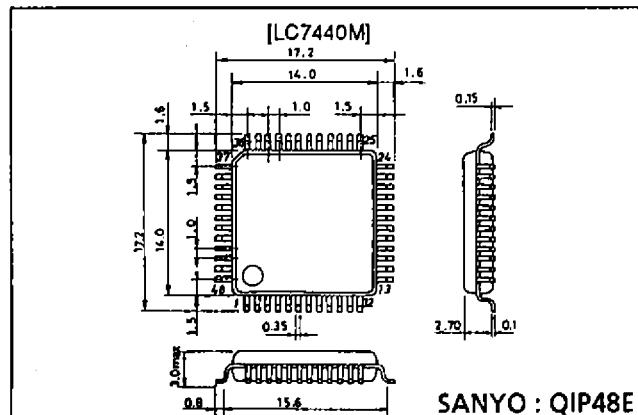

Linear phase picture controller  
Double high-pass noise canceller, high-speed AFC, DCC
- New built-in functions
  - NAP circuit
  - AVNS (advanced vertical noise suppressor)
  - Automatic QH insertion
  - FM AGC
- Miniature package (48-pin QIP or DIP)
