LA7915

Monolithic Linear IC

Peripheral Circuit for TV/VTR Frequency Synthesizer Channel Select System

The LA7915 contains CPU/PLL-excluded peripheral circuits such as switch, +5V power supply (with RST), sync detector, low-pass filter for color TV/VTR frequency synthesizer channel select system use.

Functions

- Band switch (2-input 4-output)
- Video signal, flyback pulse, AFT output-used detection of tuning mode and horizontal sync mode
- + 5V power supply, with RST output (for CPU)
- OP amp for low-pass filter (for frequency synthesizer)

Features

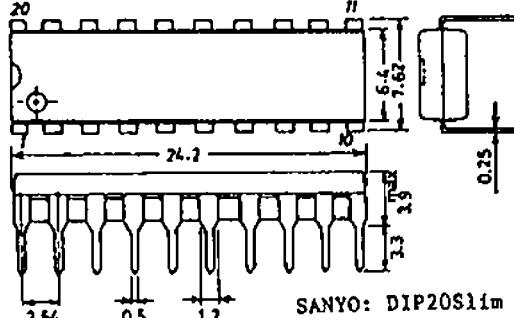

- The band switch truth table can be changed in a short period of time at the user's option.
- The band switch is of pnp output type which need not be driven externally.
- The OP amp for low-pass filter is excellent in pulse response because of its high-impedance input pin.

+5V Power Supply, RST Output

When +5V output V₈ becomes approximately 4V at the time of application of power, the reset signal is delivered at pin 9. The reset signal can be delayed by a capacitor (recommended value : 1μF) externally connected to RST output V₉.

Sample Application Circuit

VTR application: In VTR applications without flyback pulse, connect pin 2 to V_{CC} through a resistor
