

LF453

LF453 Wide-Bandwidth Dual JFET-Input Operational Amplifiers

Literature Number: SNOSC44A

LF453 Wide-Bandwidth Dual JFET-Input Operational Amplifiers

General Description

The LF453 is a low-cost, high-speed, dual JFET-input operational amplifier with an internally trimmed input offset voltage (BI-FET II technology). The device requires a low supply current and yet the amplifiers maintain a large gain bandwidth product and a fast slew rate. In addition, well matched high voltage JFET input devices provide very low input bias and offset currents. The LF453 is pin compatible with the standard LM1558, allowing designers to upgrade the overall performance of existing designs.

The LF453 may be used in such applications as high-speed integrators, fast D/A converters, sample-and-hold circuits and many other circuits requiring low input bias current, high input impedance, high slew rate and wide bandwidth.

Features

- Internally trimmed offset voltage 5.0 mV (max)
- Low input bias current 50 pA (typ)
- Low input noise current 0.01 pA/√Hz (typ)
- Wide gain bandwidth 4 MHz (typ)
- High slew rate 13 V/μs (typ)
- Low supply current 6.5 mA (max)
- High input impedance $10^{12}\Omega$ (typ)
- Low total harmonic distortion $A_V = 10, R_L = 10k, V_O = 20 V_{p-p}, f = 20 \text{ Hz} - 20 \text{ kHz}$ <0.02% (typ)
- Low 1/f noise corner 50 Hz (typ)
- Fast settling time to 0.01% 2 μs (typ)

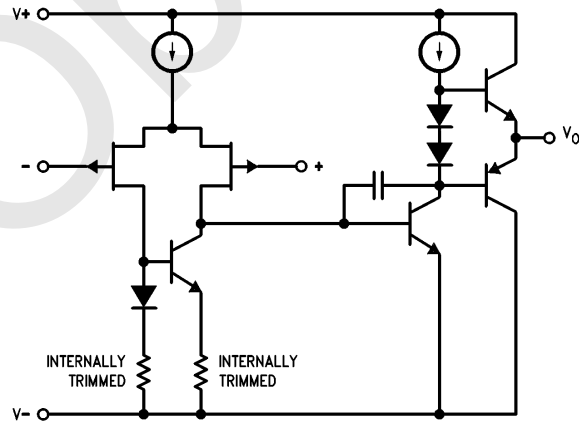

Typical Connection

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage ($V^+ - V^-$)	36V
Input Voltage Range	$V^- \leq V_{IN} \leq V^+$
Differential Input Voltage (Note 2)	$\pm 30V$
Junction Temperature (T_J MAX)	150°C
Output Short Circuit Duration	Continuous
Power Dissipation (Note 3)	500 mW
ESD Tolerance	TBD

Soldering Information (Note 4)

SO Package: Vapor Phase (60 sec.)	215°C
Infrared (15 sec.)	220°C

Operating Ratings (Note 1)

Temperature Range	$T_{MIN} \leq T_A \leq T_{MAX}$
LF453CM	$0^\circ\text{C} \leq T_A + 70^\circ\text{C}$
Junction Temperature ($T_{J\max}$)	125°C
Supply Voltage ($V^+ - V^-$)	10V to 32V

DC Electrical Characteristics The following specifications apply for $V^+ = +15V$ and $V^- = -15V$. **Bold-face limits apply for T_{MIN} to T_{MAX} ; all other limits $T_A = T_J = 25^\circ\text{C}$.**

Symbol	Parameter	Conditions	LF453CM			Units
			Typical (Note 5)	Tested Limit (Note 6)	Design Limit (Note 7)	
V_{OS}	Maximum Input Offset Voltage	$R_S = 10\text{ k}\Omega$, (Note 9)		5		mV
I_{OS}	Maximum Input Offset Current	(Notes 8, 9) $T_J = 25^\circ\text{C}$ $T_J = 70^\circ\text{C}$	25	100	2	pA nA
I_B	Maximum Input Bias Current	(Notes 8, 9) $T_J = 25^\circ\text{C}$ $T_J = 70^\circ\text{C}$	50	200	4	pA nA
R_{IN}	Input Resistance	$T_J = 25^\circ\text{C}$	10^{12}			Ω
AVOL	Minimum Large Signal Voltage Gain	$V_O = \pm 10V$, $R_L = 2\text{ k}\Omega$ (Note 9)	200	50	25	V/mV
V_O	Minimum Output Voltage Swing	$R_L = 10\text{ k}\Omega$	± 13.5	± 12	\pm 12	V
V_{CM}	Minimum Input Common Mode Voltage Range		$+14.5$ -11.5	$+11$ -11	$+$ 11 $-$ 11	V V
CMRR	Minimum Common-Mode Rejection Ratio	$R_S \leq 10\text{ k}\Omega$	100	80	80	dB
PSRR	Minimum Supply Voltage Rejection Ratio	(Note 10)	100	80	80	dB
I_S	Maximum Supply Current			6.5	6.5	mA

AC Electrical Characteristics The following specifications apply for $V^+ = +15V$ and $V^- = -15V$. Limits apply for $T_A = T_J = 25^\circ\text{C}$.

Symbol	Parameter	Conditions	LF453CM			Units
			Typical (Note 5)	Tested Limit (Note 6)	Design Limit (Note 7)	
SR	Slew Rate	$A_V = +1$	13	8		V/ μs
GBW	Minimum Gain-Bandwidth Product	$f = 100\text{ kHz}$	4	2.7		MHz
e_n	Equivalent Input Noise Voltage	$R_S = 100\Omega$, $f = 1\text{ kHz}$	25			nV/ $\sqrt{\text{Hz}}$
i_n	Equivalent Input Noise Current	$R_S = 100\Omega$, $f = 1\text{ kHz}$	0.01			pA/ $\sqrt{\text{Hz}}$

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its specified operating ratings.

Note 2: When the input voltage exceeds the power supplies, the current should be limited to 1 mA.

Note 3: The maximum power dissipation must be derated at elevated temperatures and is dictated by T_J MAX, Θ_{JA} and the ambient temperature, T_A . The maximum allowable power dissipation at any temperature is $P_D = (T_J \text{ MAX} - T_A)/\Theta_{JA}$ or the number given in the Absolute Maximum Ratings, whichever is lower. For guaranteed operation $T_{J\max} = 125^\circ\text{C}$. The typical thermal resistance (Θ_{JA}) of the LF453CM when board-mounted is 160°C/W .

Note 4: See AN-450 "Surface Mounting Methods and Their Effect on Product Reliability" (section titled "Surface Mount") for other methods of soldering surface mount devices.

Note 5: Typical values are at $T_J = 25^\circ\text{C}$ and represent most likely parametric norm.

Note 6: Tested limits are guaranteed to National's AOQL (Average Outgoing Quality Level).

Note 7: Design limits are guaranteed to National's AOQL, but not 100% tested.

Note 8: The input bias currents are junction leakage currents which approximately double for every 10°C increase in the junction temperature T_J . Due to limited production test time, the input bias currents are correlated to junction temperature. In normal operation the junction temperature rises above the ambient temperature as a result of internal power dissipation, P_D . $T_J = T_A + \Theta_{JA} P_D$ where Θ_{JA} is the thermal resistance from junction to ambient.

Note 9: V_{OS} , I_B , AVOL and I_{OS} are measured at $V_{CM} = 0V$.

Note 10: Supply voltage rejection ratio is measured for both supply magnitudes increasing or decreasing simultaneously in accordance with common practice.

Application Hints

These devices are op amps with an internally trimmed input offset voltage and JFET input devices (BI-FET II). These JFETs have large reverse breakdown voltages from gate to source and drain eliminating the need for clamps across the inputs. Therefore, large differential input voltages can easily be accommodated without a large increase in input current. The maximum differential input voltage is independent of the supply voltages. However, neither of the input voltages should be allowed to exceed the negative supply as this will cause large currents to flow which can result in a destroyed unit.

Exceeding the negative common-mode limit with the non-inverting input, or with both inputs, will force the output to a high state, potentially causing a reversal of phase to the output. In neither case does a latch occur since raising the input back within the common-mode range again puts the input stage and thus the amplifier in a normal operating mode.

Exceeding the positive common-mode limit on a single input will not change the phase of the output; however, if both inputs exceed the limit, the output of the amplifier will be forced to a high state.

The amplifiers will operate with a common-mode input voltage equal to the positive supply; however, the gain bandwidth and slew rate may be decreased in this condition. When the negative common-mode voltage swings to within 3V of the negative supply, an increase in input offset voltage may occur.

Each amplifier is individually biased by a zener reference which allows normal circuit operation on $\pm 5V$ power supplies. Supply voltages less than these may result in lower gain bandwidth and slew rate.

The amplifiers will drive a $2\text{ k}\Omega$ load resistance to $\pm 10V$ over the full temperature range of 0°C to $+70^\circ\text{C}$. If the amplifier is forced to drive heavier load currents, however, an increase in input offset voltage may occur on the negative voltage swing and finally reach an active current limit on both positive and negative swings.

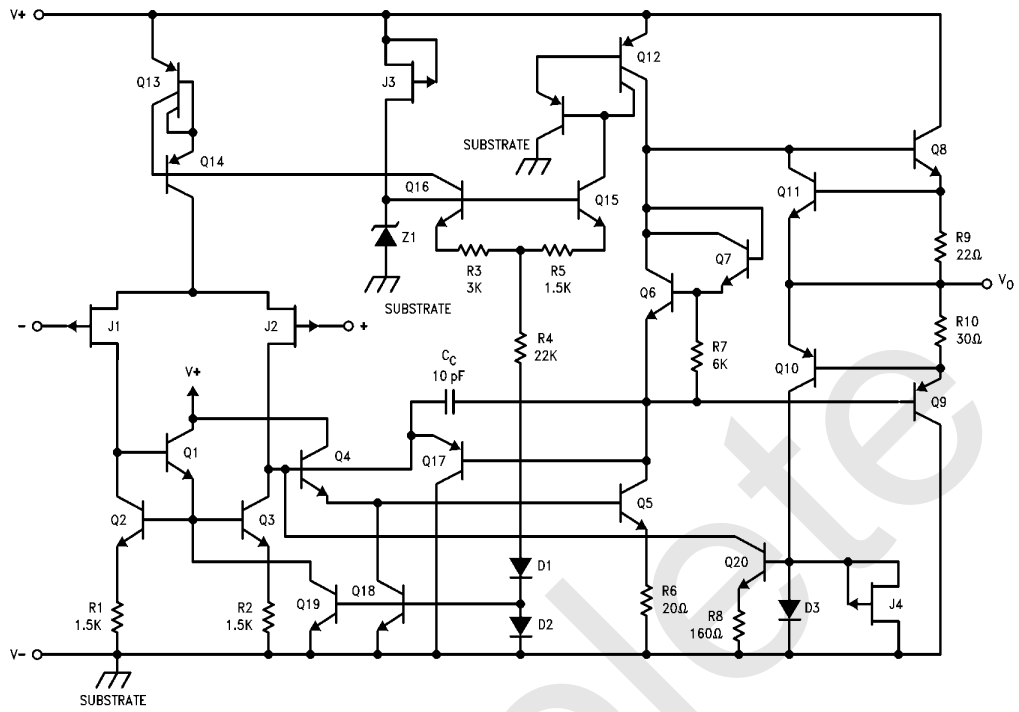

Precautions should be taken to ensure that the power supply for the integrated circuit never becomes reversed in polarity or that the unit is not inadvertently installed backwards in a socket as an unlimited current surge through the resulting forward diode within the IC could cause fusing of the internal conductors and result in a destroyed unit.

As with most amplifiers, care should be taken with lead dress, component placement and supply decoupling in order to ensure stability. For example, resistors from the output to an input should be placed with the body close to the input to minimize "pick-up" and maximize the frequency of the feedback pole by minimizing the capacitance from the input to ground.

A feedback pole is created when the feedback around any amplifier is resistive. The parallel resistance and capacitance from the input of the device (usually the inverting input) to AC ground set the frequency of the pole. In many instances the frequency of this pole is much greater than the expected 3 dB frequency of the closed loop gain and consequently there is negligible effect on stability margin. However, if the feedback pole is less than approximately 6 times the expected 3 dB frequency a lead capacitor should be placed from the output to the input of the op amp. The value of the added capacitor should be such that the RC time constant of this capacitor and the resistance it parallels is greater than or equal to the original feedback pole time constant.

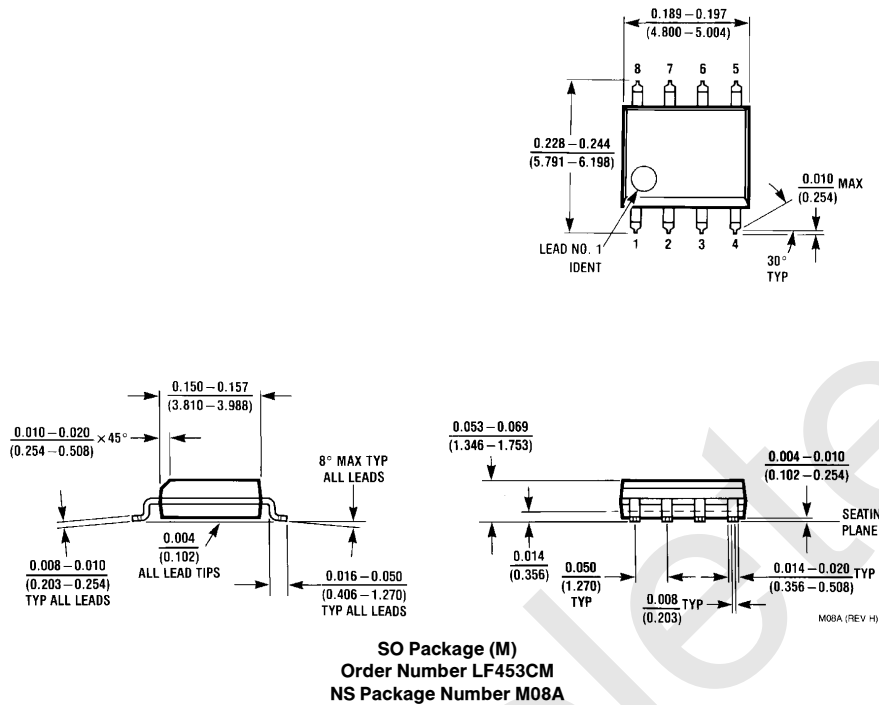

The benefit of the SO package results from its very small size. It follows, however, that the die inside the SO package is less protected from external physical forces than a die in a standard DIP would be, because there is so much less plastic in the SO. Therefore, not following certain precautions when board mounting the LF453CM can put mechanical stress on the die, lead frame, and/or bond wires. This can cause shifts in the LF453CM's parameters, even causing them to exceed limits specified in the Electrical Characteristics. For recommended practices in LF453CM surface mounting refer to Application Note AN450 "Surface Mounting Methods and Their Effect on Product Reliability" and to the section titled "Surface Mount" found in any Rev 1. LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
