

LM124/224/324/324A/ SA534/LM2902

Low Power Quad Op Amps

Product Specification

Linear Products

DESCRIPTION

The LM124/SA534/LM2902 series consists of four independent, high-gain, internally frequency-compensated operational amplifiers designed specifically to operate from a single power supply over a wide range of voltages.

UNIQUE FEATURES

In the linear mode, the input common-mode voltage range includes ground and the output voltage can also swing to ground, even though operated from only a single power supply voltage.

The unity gain crossover frequency and the input bias current are temperature-compensated.

FEATURES

- Internally frequency-compensated for unity gain
- Large DC voltage gain: 100dB
- Wide bandwidth (unity gain): 1MHz (temperature-compensated)
- Wide power supply range
Single supply: $3V_{DC}$ to $30V_{DC}$
or dual supplies: $\pm 1.5V_{DC}$ to $\pm 15V_{DC}$
- Very low supply current drain: essentially independent of supply voltage (1mW/op amp at $+5V_{DC}$)
- Low input biasing current: $45nA_{DC}$ (temperature-compensated)
- Low input offset voltage: 2mV_{DC} and offset current: 5nA_{DC}
- Differential input voltage range equal to the power supply voltage
- Large output voltage: $0V_{DC}$ to $V_{CC} - 1.5V_{DC}$ swing

PIN CONFIGURATION

ORDERING INFORMATION

DESCRIPTION	TEMPERATURE RANGE	ORDER CODE
14-Pin Plastic DIP	-55°C to +125°C	LM124N
14-Pin Ceramic DIP	-55°C to +125°C	LM124F
14-Pin Plastic DIP	-25°C to +85°C	LM224N
14-Pin Ceramic DIP	-25°C to +85°C	LM224F
14-Pin Plastic DIP	0 to +70°C	LM324N
14-Pin Ceramic DIP	0 to +70°C	LM324F
14-Pin Plastic SO	0 to +70°C	LM324D
14-Pin Plastic DIP	0 to +70°C	LM324AN
14-Pin Plastic SO	0 to +70°C	LM324AD
14-Pin Plastic DIP	-40°C to +85°C	SA534N
14-Pin Ceramic DIP	-40°C to +85°C	SA534F
14-Pin Plastic SO	-40°C to +85°C	SA534D
14-Pin Plastic SO	-40°C to +85°C	LM2902D
14-Pin Plastic DIP	-40°C to +85°C	LM2902N

Low Power Quad Op Amps

LM124/224/324/324A/SA534/LM2902

ABSOLUTE MAXIMUM RATINGS

SYMBOL	PARAMETER	RATING	UNIT
V_{CC}	Supply voltage	32 or ± 16	V_{DC}
V_{IN}	Differential input voltage	32	V_{DC}
V_{IN}	Input voltage	-0.3 to +32	V_{DC}
P_D	Maximum power dissipation, $T_A = 25^\circ\text{C}$ (still-air) ¹		
	N package	1420	mW
	F package	1190	mW
	D package	1040	mW
	Output short-circuit to GND one amplifier ² $V_{CC} < 15V_{DC}$ and $T_A = 25^\circ\text{C}$	Continuous	
I_{IN}	Input current ($V_{IN} < -0.3V$) ³	50	mA
T_A	Operating ambient temperature range		$^\circ\text{C}$
	LM324/A	0 to +70	$^\circ\text{C}$
	LM224	-25 to +85	$^\circ\text{C}$
	SA534/LM2902	-40 to +85	$^\circ\text{C}$
	LM124	-55 to +125	$^\circ\text{C}$
T_{STG}	Storage temperature range	-65 to +150	$^\circ\text{C}$
T_{SOLD}	Lead soldering temperature (10sec max)	300	$^\circ\text{C}$

NOTES:

1. Derate above 25°C , at the following rates:

F package at 9.5mW/ $^\circ\text{C}$

N package at 11.4mW/ $^\circ\text{C}$

D package at 8.3mW/ $^\circ\text{C}$

2. Short-circuits from the output to V_{CC+} can cause excessive heating and eventual destruction. The maximum output current is approximately 40mA, independent of the magnitude of V_{CC} . At values of supply voltage in excess of $+15V_{DC}$ continuous short-circuits can exceed the power dissipation ratings and cause eventual destruction.

3. This input current will only exist when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistors becoming forward biased and thereby acting as input bias clamps. In addition, there is also lateral NPN parasitic transistor action on the IC chip. This action can cause the output voltages of the op amps to go to the $V+$ rail (or to ground for a large overdrive) during the time that the input is driven negative.

Low Power Quad Op Amps

LM124/224/324/324A/SA534/LM2902

DC ELECTRICAL CHARACTERISTICS (Continued) $V_{CC} = 5V$, $T_A = 25^\circ C$, unless otherwise specified.

SYMBOL	PARAMETER	TEST CONDITIONS	LM324A			UNIT
			Min	Typ	Max	
GBW	Unity gain bandwidth			1		MHz
SR	Slew rate			0.3		V/ μ s
V_{NOISE}	Input noise voltage	$f = 1\text{kHz}$		40		nV/ $\sqrt{\text{Hz}}$

NOTES:

1. $V_O \approx 1.4V_{DC}$, $R_S = 0\Omega$ with V_{CC} from 5V to 30V and over full input common-mode range ($0V_{DC}$ to $V_{CC} - 1.5V$).
2. The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output so no loading change exists on the input lines.
3. The input common-mode voltage or either input signal voltage should not be allowed to go negative by more than 0.3V. The upper end of the common-mode voltage range is $V_{CC} - 1.5$, but either or both inputs can go to +32V without damage.
4. Short-circuits from the output to V_{CC} can cause excessive heating and eventual destruction. The maximum output current is approximately 40mA independent of the magnitude of V_{CC} . At values of supply voltage in excess of +15V_{DC}, continuous short-circuits can exceed the power dissipation ratings and cause eventual destruction. Destructive dissipation can result from simultaneous shorts on all amplifiers.
5. Due to proximity of external components, insure that coupling is not originating via stray capacitance between these external parts. This typically can be detected as this type of coupling increases at higher frequencies.
