

LM2936-3.3

Ultra-Low Quiescent Current 3.3V Regulator

General Description

The LM2936-3.3 ultra-low quiescent current regulator features low dropout voltage and low current in the standby mode. With less than 20 μ A quiescent current at a 100 μ A load, the LM2936-3.3 is ideally suited for automotive and other battery operated systems. The LM2936-3.3 retains all of the features that are common to low dropout regulators including a low dropout PNP pass device, short circuit protection, reverse battery protection, and thermal shutdown. The LM2936-3.3 has a 40V maximum operating voltage limit, a -40°C to $+125^{\circ}\text{C}$ operating temperature range, and $\pm 3\%$ output voltage tolerance over the entire output current, input voltage, and temperature range. The LM2936-3.3 is available in a TO-92 package, a SO-8 surface mount package, as well as SOT-223 and TO-252 surface mount power packages.

Features

- Ultra low quiescent current ($I_Q \leq 20 \mu\text{A}$ for $I_O \leq 100 \mu\text{A}$)
- Fixed 3.3V, 50 mA output
- $\pm 2\%$ Initial output tolerance
- $\pm 3\%$ Output tolerance over line, load, and temperature
- Dropout voltage typically 200 mV @ $I_O = 50 \text{ mA}$
- Reverse battery protection
- -50V reverse transient protection
- Internal short circuit current limit
- Internal thermal shutdown protection
- 40V operating voltage limit

Typical Application

DS101324-1

* Required if regulator is located more than 2" from power supply filter capacitor.

** Required for stability. Must be rated for 22 μF minimum over intended operating temperature range. Effective series resistance (ESR) is critical, see curve. Locate capacitor as close as possible to the regulator output and ground pins. Capacitance may be increased without bound.

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Input Voltage (Survival)	+60V, -50V	TO-92 (Z03A) θ_{JA}	195°C/W
ESD Susceptibility (Note 2)	2000V	SO-8 (M08A) θ_{JA}	140°C/W
Power Dissipation (Note 3)	Internally limited	SO-8 (M08A) θ_{JC}	45°C/W
Junction Temperature (T_{Jmax})	150°C	TO-252 (TD03B) θ_{JA}	126°C/W
Storage Temperature Range	-65°C to +150°C	TO-252 (TD03B) θ_{JC}	6°C/W
Lead Temperature (Soldering, 10 sec.)	260°C	SOT-223 (MA04A) θ_{JA}	149°C/W
		SOT-223 (MA04A) θ_{JC}	36°C/W

Operating Ratings

Operating Temperature Range	-40°C to +125°C
Maximum Input Voltage (Operational)	40V

Electrical Characteristics

$V_{IN} = 14V$, $I_O = 10\text{ mA}$, $T_J = 25^\circ\text{C}$, unless otherwise specified. **Boldface** limits apply over entire operating temperature range

Parameter	Conditions	Min (Note 5)	Typical (Note 4)	Max (Note 5)	Units
Output Voltage		3.234	3.300	3.366	V
	$4.0V \leq V_{IN} \leq 26V$, $100\mu A \leq I_O \leq 50\text{mA}$ (Note 6)	3.201	3.30	3.399	
Quiescent Current	$I_O = 100\mu A$, $8V \leq V_{IN} \leq 24V$		15	20	μA
	$I_O = 10\text{ mA}$, $8V \leq V_{IN} \leq 24V$		0.20	0.50	mA
	$I_O = 50\text{ mA}$, $8V \leq V_{IN} \leq 24V$		1.5	2.5	mA
Line Regulation	$9V \leq V_{IN} \leq 16V$		5	10	mV
	$6V \leq V_{IN} \leq 40V$, $I_O = 1\text{ mA}$		10	30	
Load Regulation	$100\mu A \leq I_O \leq 5\text{ mA}$		10	30	mV
	$5\text{ mA} \leq I_O \leq 50\text{ mA}$		10	30	
Dropout Voltage	$I_O = 100\mu A$		0.05	0.10	V
	$I_O = 50\text{ mA}$		0.20	0.40	V
Short Circuit Current	$V_O = 0V$	65	120	250	mA
Output Impedance	$I_O = 30\text{ mAdc}$ and 10 mArms , $f = 1000\text{ Hz}$		450		$m\Omega$
Output Noise Voltage	10 Hz–100 kHz		500		μV
Long Term Stability			20		$mV/1000\text{ Hr}$
Ripple Rejection	$V_{ripple} = 1V_{rms}$, $f_{ripple} = 120\text{ Hz}$	-40	-60		dB
Reverse Polarity	$R_L = 500\Omega$, $V_O \geq -0.3V$	-15			V
DC Input Voltage					
Reverse Polarity	$R_L = 500\Omega$, $T = 1\text{ ms}$	-50	-80		V
Transient Input Voltage					
Output Leakage with Reverse Polarity Input	$V_{IN} = -15V$, $R_L = 500\Omega$		-0.1	-600	μA
Maximum Line Transient	$R_L = 500\Omega$, $V_O \leq 3.63V$	60			V

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its specified operating ratings.

Note 2: Human body model, 100 pF discharge through a 1.5 kΩ resistor.

Note 3: The maximum power dissipation is a function of T_{Jmax} , θ_{JA} , and T_A . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{Jmax} - T_A)/\theta_{JA}$. If this dissipation is exceeded, the die temperature will rise above 150°C and the LM2936 will go into thermal shutdown.

Note 4: Typicals are at 25°C (unless otherwise specified) and represent the most likely parametric norm.

Note 5: Tested limits are guaranteed to National's AOQL (Average Outgoing Quality Level) and 100% tested.

Note 6: To ensure constant junction temperature, pulse testing is used.

Applications Information

Unlike other PNP low dropout regulators, the LM2936 remains fully operational to 40V. Owing to power dissipation characteristics of the available packages, full output current cannot be guaranteed for all combinations of ambient temperature and input voltage. As an example, consider an LM2936Z-3.3 operating at 25°C ambient. Using the formula for maximum allowable power dissipation given in (Note 3), we find that $P_{Dmax} = 641\text{ mW}$ at 25°C. Including the small contribution of the quiescent current to total power dissipation the maximum input voltage (while still delivering 50 mA output current) is 15.3V. The LM2936Z-3.3 will go into thermal shutdown if it attempts to deliver full output current with an input voltage of more than 15.3V. Similarly, at 40V input and 25°C ambient the LM2936Z-3.3 can deliver 15 mA maximum.

Under conditions of higher ambient temperatures, the voltage and current calculated in the previous examples will drop. For instance, at the maximum ambient of 125°C the LM2936Z-3.3 can only dissipate 128 mW, limiting the input voltage to 5.6V for a 50 mA load, or 3.0 mA output current for a 40V input.

The junction to ambient thermal resistance θ_{JA} rating has two distinct components: the junction to case thermal resistance rating θ_{JC} ; and the case to ambient thermal resistance rating θ_{CA} . The relationship is defined as: $\theta_{JA} = \theta_{JC} + \theta_{CA}$.

For the SO-8 and TO-252 surface mount packages the θ_{JA} rating can be improved by using the copper mounting pads on the printed circuit board as a thermal conductive path to extract heat from the package.

On the SO-8 package the four ground pins are thermally connected to the backside of the die. Adding approximately 0.04 square inches of 2 oz. copper pad area to these four pins will improve the θ_{JA} rating to approximately 110°C/W. If this extra pad are is placed directly beneath the package there should not be any impact on board density.

On the TO-252 package the ground tab is thermally connected to the backside of the die. Adding 1 square inch of 2 oz. copper pad area directly under the ground tab will improve the θ_{JA} rating to approximately 50°C/W.

While the LM2936 has an internally set thermal shutdown point of typically 150°C, this is intended as a safety feature only. Continuous operation near the thermal shutdown temperature should be avoided as it may have a negative affect on the life of the device.

While the LM2936-3.3 will survive input transients to +60V, output regulation is not guaranteed for input voltages greater than 40V. The LM2936 will not withstand a output short circuit with the input above 40V because of safe operating area limitations in the internal PNP pass device. With input voltages above 60V the LM2936 will break down with catastrophic effects on the regulator and possibly the load as well. Do not use this device in a design where the input operating voltage may exceed 40V, or where transients are likely to exceed 60V.

Notes

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
