

LM113/LM313 Reference Diode

General Description

The LM113/LM313 are temperature compensated, low voltage reference diodes. They feature extremely-tight regulation over a wide range of operating currents in addition to an unusually-low breakdown voltage and good temperature stability.

The diodes are synthesized using transistors and resistors in a monolithic integrated circuit. As such, they have the same low noise and long term stability as modern IC op amps. Further, output voltage of the reference depends only on highly-predictable properties of components in the IC; so they can be manufactured and supplied to tight tolerances.

- Dynamic impedance of 0.3Ω from $500\mu\text{A}$ to 20mA
- Temperature stability typically 1% over -55°C to 125°C range (LM113), 0°C to 70°C (LM313)
- Tight tolerance: $\pm 5\%$, $\pm 2\%$ or $\pm 1\%$

The characteristics of this reference recommend it for use in bias-regulation circuitry, in low-voltage power supplies or in battery powered equipment. The fact that the breakdown voltage is equal to a physical property of silicon—the energy-band gap voltage—makes it useful for many temperature-compensation and temperature-measurement functions.

Note 1: For operating at elevated temperatures, the device must be derated based on a 150°C maximum junction and a thermal resistance of $80^{\circ}\text{C}/\text{W}$ junction to case or $440^{\circ}\text{C}/\text{W}$ junction to ambient.

Note 2: These specifications apply for $T_A = 25^{\circ}\text{C}$, unless stated otherwise. At high currents, breakdown voltage should be measured with lead lengths less than $1/4$ inch. Kelvin contact sockets are also recommended. The diode should not be operated with shunt capacitances between 200 pF and $0.1 \mu\text{F}$, unless isolated by at least a 100Ω resistor, as it may oscillate at some currents.

Note 3: Refer to the following RETS drawings for military specifications: RETS113-1X for LM113-1, RETS113-2X for LM113-2 or RETS113X for LM113.
