

# LM134/LM234/LM334

## 3-Terminal Adjustable Current Sources

### General Description

The LM134/LM234/LM334 are 3-terminal adjustable current sources featuring 10,000:1 range in operating current, excellent current regulation and a wide dynamic voltage range of 1V to 40V. Current is established with one external resistor and no other parts are required. Initial current accuracy is  $\pm 3\%$ . The LM134/LM234/LM334 are true floating current sources with no separate power supply connections. In addition, reverse applied voltages of up to 20V will draw only a few dozen microamperes of current, allowing the devices to act as both a rectifier and current source in AC applications.

The sense voltage used to establish operating current in the LM134 is 64 mV at 25°C and is directly proportional to absolute temperature ( $^{\circ}\text{K}$ ). The simplest one external resistor connection, then, generates a current with  $\approx +0.33\%/^{\circ}\text{C}$  temperature dependence. Zero drift operation can be obtained by adding one extra resistor and a diode.

Applications for the current sources include bias networks, surge protection, low power reference, ramp generation, LED driver, and temperature sensing. The LM134-3/

LM234-3 and LM134-6/LM234-6 are specified as true temperature sensors with guaranteed initial accuracy of  $\pm 3^{\circ}\text{C}$  and  $\pm 6^{\circ}\text{C}$ , respectively. These devices are ideal in remote sense applications because series resistance in long wire runs does not affect accuracy. In addition, only 2 wires are required.

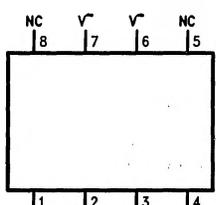

The LM134 is guaranteed over a temperature range of  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ , the LM234 from  $-25^{\circ}\text{C}$  to  $+100^{\circ}\text{C}$  and the LM334 from  $0^{\circ}\text{C}$  to  $+70^{\circ}\text{C}$ . These devices are available in TO-46 hermetic, TO-92 and SO-8 plastic packages.

### Features

- Operates from 1V to 40V
- 0.02%/V current regulation
- Programmable from 1  $\mu\text{A}$  to 10 mA
- True 2-terminal operation
- Available as fully specified temperature sensor
- $\pm 3\%$  initial accuracy

## Electrical Characteristics (Note 1)

Parameter	Conditions	LM134/LM234			LM334			Units
		Min	Typ	Max	Min	Typ	Max	
Set Current Error, $V^+ = 2.5V$ , (Note 2)	$10 \mu A \leq I_{SET} \leq 1 \text{ mA}$			3			6	%
	$1 \text{ mA} < I_{SET} \leq 5 \text{ mA}$			5			8	%
	$2 \mu A \leq I_{SET} < 10 \mu A$			8			12	%
Ratio of Set Current to Bias Current	$100 \mu A \leq I_{SET} \leq 1 \text{ mA}$	14	18	23	14	18	26	
	$1 \text{ mA} \leq I_{SET} \leq 5 \text{ mA}$		14			14		
	$2 \mu A \leq I_{SET} \leq 100 \mu A$		18	23		18	26	
Minimum Operating Voltage	$2 \mu A \leq I_{SET} \leq 100 \mu A$		0.8			0.8		V
	$100 \mu A < I_{SET} \leq 1 \text{ mA}$		0.9			0.9		V
	$1 \text{ mA} < I_{SET} \leq 5 \text{ mA}$		1.0			1.0		V
Average Change in Set Current with Input Voltage	$2 \mu A \leq I_{SET} \leq 1 \text{ mA}$							
	$1.5 \leq V^+ \leq 5V$		0.02	0.05		0.02	0.1	%/V
	$5V \leq V^+ \leq 40V$		0.01	0.03		0.01	0.05	%/V
	$1 \text{ mA} < I_{SET} \leq 5 \text{ mA}$							
	$1.5V \leq V \leq 5V$		0.03			0.03		%/V
Temperature Dependence of Set Current (Note 3)	$5V \leq V \leq 40V$		0.02			0.02		%/V
	$25 \mu A \leq I_{SET} \leq 1 \text{ mA}$	0.96T	T	1.04T	0.96T	T	1.04T	
Effective Shunt Capacitance			15			15		pF

**Note 1:** Unless otherwise specified, tests are performed at  $T_j = 25^\circ\text{C}$  with pulse testing so that junction temperature does not change during test.

**Note 2:** Set current is the current flowing into the  $V^+$  pin. For the Basic 2-Terminal Current Source circuit shown on the first page of this data sheet,  $I_{SET}$  is determined by the following formula:  $I_{SET} = 67.7 \text{ mV}/R_{SET}$  (@  $25^\circ\text{C}$ ). Set current error is expressed as a percent deviation from this amount.  $I_{SET}$  increases at 0.336%/°C @  $T_j = 25^\circ\text{C}$  (227  $\mu\text{V}/^\circ\text{C}$ ).

**Note 3:**  $I_{SET}$  is directly proportional to absolute temperature (°K).  $I_{SET}$  at any temperature can be calculated from:  $I_{SET} = I_0 (T/T_0)$  where  $I_0$  is  $I_{SET}$  measured at  $T_0$  (°K).

**Note 4:** For elevated temperature operation,  $T_j$  max is:

LM134	150°C
LM234	125°C
LM334	100°C

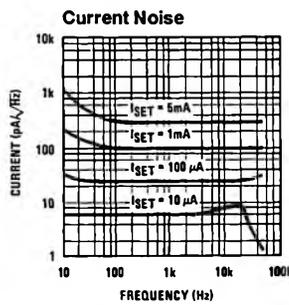

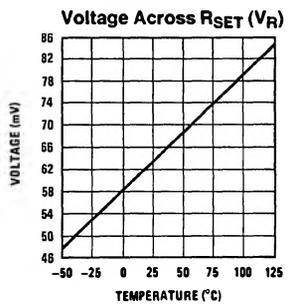

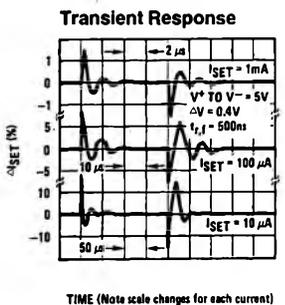

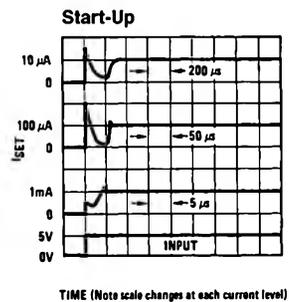

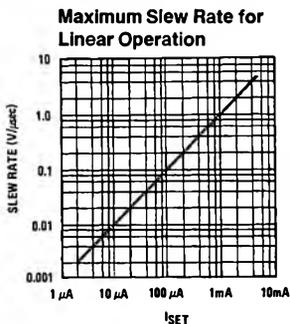

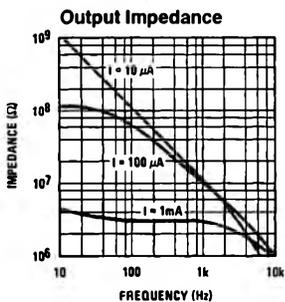

Thermal Resistance	TO-92	TO-46	SO-8
$\theta_{ja}$ (Junction to Ambient)	180°C/W (0.4" leads) 160°C/W (0.125" leads)	440°C/W	165°C/W
$\theta_{jc}$ (Junction to Case)	N/A	32°C/W	80°C/W

**Note 5:** Human body model, 100 pF discharged through a 1.5 k $\Omega$  resistor.

TL/H/5697-3

## Application Hints

The LM134 has been designed for ease of application, but a general discussion of design features is presented here to familiarize the designer with device characteristics which may not be immediately obvious. These include the effects of slewing, power dissipation, capacitance, noise, and contact resistance.

### CALCULATING $R_{\text{SET}}$

The total current through the LM134 ( $I_{\text{SET}}$ ) is the sum of the current going through the SET resistor ( $I_{\text{R}}$ ) and the LM134's bias current ( $I_{\text{BIAS}}$ ), as shown in Figure 1.

TL/H/5697-27

**FIGURE 1. Basic Current Source**

A graph showing the ratio of these two currents is supplied under **Ratio of  $I_{\text{SET}}$  to  $I_{\text{BIAS}}$**  in the Typical Performance Characteristics section. The current flowing through  $R_{\text{SET}}$  is determined by  $V_{\text{R}}$ , which is approximately  $214 \mu\text{V}/^\circ\text{K}$  ( $64 \text{ mV}/298^\circ\text{K} \sim 214 \mu\text{V}/^\circ\text{K}$ ).

$$I_{\text{SET}} = I_{\text{R}} + I_{\text{BIAS}} = \frac{V_{\text{R}}}{R_{\text{SET}}} + I_{\text{BIAS}}$$

Since (for a given set current)  $I_{\text{BIAS}}$  is simply a percentage of  $I_{\text{SET}}$ , the equation can be rewritten

$$I_{\text{SET}} = \left( \frac{V_{\text{R}}}{R_{\text{SET}}} \right) \left( \frac{n}{n-1} \right)$$

where  $n$  is the ratio of  $I_{\text{SET}}$  to  $I_{\text{BIAS}}$  as specified in the Electrical Characteristics Section and shown in the graph. Since  $n$  is typically 18 for  $2 \mu\text{A} \leq I_{\text{SET}} \leq 1 \text{ mA}$ , the equation can be further simplified to

$$I_{\text{SET}} = \left( \frac{V_{\text{R}}}{R_{\text{SET}}} \right) (1.059) = \frac{227 \mu\text{V}/^\circ\text{K}}{R_{\text{SET}}}$$

for most set currents.

### SLEW RATE

At slew rates above a given threshold (see curve), the LM134 may exhibit non-linear current shifts. The slewing rate at which this occurs is directly proportional to  $I_{\text{SET}}$ . At  $I_{\text{SET}} = 10 \mu\text{A}$ , maximum  $dV/dt$  is  $0.01\text{V}/\mu\text{s}$ ; at  $I_{\text{SET}} = 1 \text{ mA}$ , the limit is  $1\text{V}/\mu\text{s}$ . Slew rates above the limit do not harm the LM134, or cause large currents to flow.

### THERMAL EFFECTS

Internal heating can have a significant effect on current regulation for  $I_{\text{SET}}$  greater than  $100 \mu\text{A}$ . For example, each  $1\text{V}$  increase across the LM134 at  $I_{\text{SET}} = 1 \text{ mA}$  will increase junction temperature by  $\approx 0.4^\circ\text{C}$  in still air. Output current ( $I_{\text{SET}}$ ) has a temperature coefficient of  $\approx 0.33\%/^\circ\text{C}$ , so the change in current due to temperature rise will be  $(0.4)(0.33) = 0.132\%$ . This is a 10:1 degradation in regulation compared to true electrical effects. Thermal effects, therefore, must be taken into account when DC regulation is critical and  $I_{\text{SET}}$  exceeds  $100 \mu\text{A}$ . Heat sinking of the TO-46 package or the TO-92 leads can reduce this effect by more than 3:1.

## Application Hints (Continued)

### SHUNT CAPACITANCE

In certain applications, the 15 pF shunt capacitance of the LM134 may have to be reduced, either because of loading problems or because it limits the AC output impedance of the current source. This can be easily accomplished by buffering the LM134 with an FET as shown in the applications. This can reduce capacitance to less than 3 pF and improve regulation by at least an order of magnitude. DC characteristics (with the exception of minimum input voltage), are not affected.

### NOISE

Current noise generated by the LM134 is approximately 4 times the shot noise of a transistor. If the LM134 is used as an active load for a transistor amplifier, input referred noise will be increased by about 12 dB. In many cases, this is acceptable and a single stage amplifier can be built with a voltage gain exceeding 2000.

### LEAD RESISTANCE

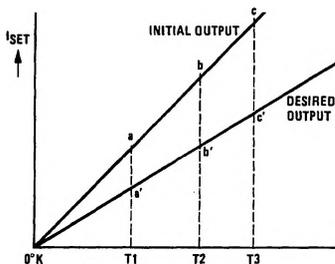

The sense voltage which determines operating current of the LM134 is less than 100 mV. At this level, thermocouple or lead resistance effects should be minimized by locating the current setting resistor physically close to the device. Sockets should be avoided if possible. It takes only  $0.7\Omega$  contact resistance to reduce output current by 1% at the 1 mA level.

### SENSING TEMPERATURE

The LM134 makes an ideal remote temperature sensor because its current mode operation does not lose accuracy over long wire runs. Output current is directly proportional to absolute temperature in degrees Kelvin, according to the following formula:

$$I_{SET} = \frac{(227 \mu\text{V}/^\circ\text{K})(T)}{R_{SET}}$$

Calibration of the LM134 is greatly simplified because of the fact that most of the initial inaccuracy is due to a gain term (slope error) and not an offset. This means that a calibration consisting of a gain adjustment only will trim both slope and zero at the same time. In addition, gain adjustment is a one point trim because the output of the LM134 extrapolates to zero at  $0^\circ\text{K}$ , independent of  $R_{SET}$  or any initial inaccuracy.

TL/H/5697-4

FIGURE 2. Gain Adjustment

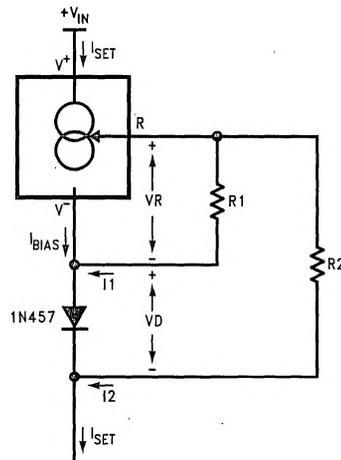

This property of the LM134 is illustrated in the accompanying graph. Line abc is the sensor current before trimming. Line a'b'c' is the desired output. A gain trim done at T2 will move the output from b to b' and will simultaneously correct the slope so that the output at T1 and T3 will be correct. This gain trim can be done on  $R_{SET}$  or on the load resistor

used to terminate the LM134. Slope error after trim will normally be less than  $\pm 1\%$ . To maintain this accuracy, however, a low temperature coefficient resistor must be used for  $R_{SET}$ .

A 33 ppm/ $^\circ\text{C}$  drift of  $R_{SET}$  will give a 1% slope error because the resistor will normally see about the same temperature variations as the LM134. Separating  $R_{SET}$  from the LM134 requires 3 wires and has lead resistance problems, so is not normally recommended. Metal film resistors with less than 20 ppm/ $^\circ\text{C}$  drift are readily available. Wire wound resistors may also be used where best stability is required.

### APPLICATION AS A ZERO TEMPERATURE COEFFICIENT CURRENT SOURCE

Adding a diode and a resistor to the standard LM134 configuration can cancel the temperature-dependent characteristic of the LM134. The circuit shown in Figure 3 balances the positive tempco of the LM134 (about  $+0.23 \text{ mV}/^\circ\text{C}$ ) with the negative tempco of a forward-biased silicon diode (about  $-2.5 \text{ mV}/^\circ\text{C}$ ).

TL/H/5697-28

FIGURE 3. Zero Tempco Current Source

The set current ( $I_{SET}$ ) is the sum of  $I_1$  and  $I_2$ , each contributing approximately 50% of the set current, and  $I_{BIAS}$ .  $I_{BIAS}$  is usually included in the  $I_1$  term by increasing the  $V_R$  value used for calculations by 5.9%. (See **CALCULATING  $R_{SET}$** .)

$$I_{SET} = I_1 + I_2 + I_{BIAS}, \text{ where}$$

$$I_1 = \frac{V_R}{R_1} \text{ and } I_2 = \frac{V_R + V_D}{R_2}$$

The first step is to minimize the tempco of the circuit, using the following equations. An example is given using a value of  $+227 \mu\text{V}/^\circ\text{C}$  as the tempco of the LM134 (which includes the  $I_{BIAS}$  component), and  $-2.5 \text{ mV}/^\circ\text{C}$  as the tempco of the diode (for best results, this value should be directly measured or obtained from the manufacturer of the diode).

$$I_{SET} = I_1 + I_2$$

$$\frac{dI_{SET}}{dT} = \frac{dI_1}{dT} + \frac{dI_2}{dT}$$

$$\approx \frac{227 \mu\text{V}/^\circ\text{C}}{R_1} + \frac{227 \mu\text{V}/^\circ\text{C} - 2.5 \text{ mV}/^\circ\text{C}}{R_2}$$

$$= 0 \text{ (solve for tempco} = 0)$$

## Application Hints (Continued)

$$\frac{R_2}{R_1} \approx \frac{2.5 \text{ mV}/^\circ\text{C} - 227 \text{ } \mu\text{V}/^\circ\text{C}}{227 \text{ } \mu\text{V}/^\circ\text{C}} \approx 10.0$$

With the  $R_1$  to  $R_2$  ratio determined, values for  $R_1$  and  $R_2$  should be determined to give the desired set current. The formula for calculating the set current at  $T = 25^\circ\text{C}$  is shown below, followed by an example that assumes the forward voltage drop across the diode ( $V_D$ ) is 0.6V, the voltage across  $R_1$  is 67.7 mV (64 mV + 5.9% to account for  $I_{BIAS}$ ), and  $R_2/R_1 = 10$  (from the previous calculations).

$$\begin{aligned} I_{SET} &= I_1 + I_2 + I_{BIAS} \\ &= \frac{V_R}{R_1} + \frac{V_R + V_D}{R_2} \\ &\approx \frac{67.7 \text{ mV}}{R_1} + \frac{67.7 \text{ mV} + 0.6\text{V}}{10.0 R_1} \\ I_{SET} &\approx \frac{0.134\text{V}}{R_1} \end{aligned}$$

This circuit will eliminate most of the LM134's temperature coefficient, and it does a good job even if the estimates of the diode's characteristics are not accurate (as the following example will show). For lowest tempco with a specific diode at the desired  $I_{SET}$ , however, the circuit should be built and tested over temperature. If the measured tempco of  $I_{SET}$  is positive,  $R_2$  should be reduced. If the resulting tempco is negative,  $R_2$  should be increased. The recommended diode for use in this circuit is the 1N457 because its tempco is centered at 11 times the tempco of the LM134, allowing  $R_2 = 10 R_1$ . You can also use this circuit to create a current source with non-zero tempcos by setting the tempco component of the tempco equation to the desired value instead of 0.

EXAMPLE: A 1 mA, Zero-Tempco Current Source

First, solve for  $R_1$  and  $R_2$ :

$$\begin{aligned} I_{SET} &\approx 1 \text{ mA} = \frac{0.134\text{V}}{R_1} \\ R_1 &= 134\Omega = 10 R_2 \\ R_2 &= 13.4\Omega \end{aligned}$$

The values of  $R_1$  and  $R_2$  can be changed to standard 1% resistor values ( $R_1 = 133\Omega$  and  $R_2 = 1.33 \text{ k}\Omega$ ) with less than a 0.75% error.

If the forward voltage drop of the diode was 0.65V instead of the estimate of 0.6V (an error of 8%), the actual set current will be

$$\begin{aligned} I_{SET} &= \frac{67.7 \text{ mV}}{R_1} + \frac{67.7 \text{ mV} + 0.65\text{V}}{R_2} \\ &= \frac{67.7 \text{ mV}}{133} + \frac{67.7 \text{ mV} + 0.65\text{V}}{1330} \\ &= 1.049 \text{ mA} \end{aligned}$$

an error of less than 5%.

If the estimate for the tempco of the diode's forward voltage drop was off, the tempco cancellation is still reasonably effective. Assume the tempco of the diode is 2.6 mV/ $^\circ\text{C}$  instead of 2.5 mV/ $^\circ\text{C}$  (an error of 4%). The tempco of the circuit is now:

$$\begin{aligned} \frac{dI_{SET}}{dT} &= \frac{dI_1}{dT} + \frac{dI_2}{dT} \\ &= \frac{227 \text{ } \mu\text{V}/^\circ\text{C}}{133\Omega} + \frac{227 \text{ } \mu\text{V}/^\circ\text{C} - 2.6 \text{ mV}/^\circ\text{C}}{1330\Omega} \\ &= -77 \text{ nA}/^\circ\text{C} \end{aligned}$$

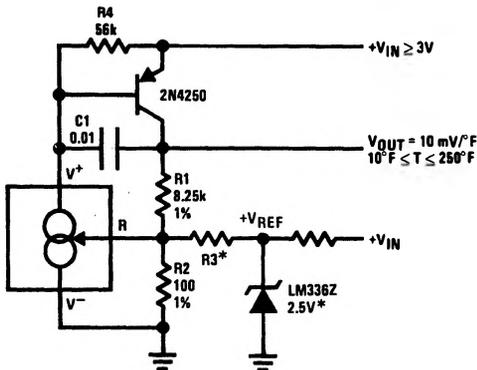

A 1 mA LM134 current source with no temperature compensation would have a set resistor of 68 $\Omega$  and a resulting tempco of

$$\frac{227 \text{ } \mu\text{V}/^\circ\text{C}}{68\Omega} = 3.3 \text{ } \mu\text{A}/^\circ\text{C}$$

So even if the diode's tempco varies as much as  $\pm 4\%$  from its estimated value, the circuit still eliminates 98% of the LM134's inherent tempco.

## Typical Applications

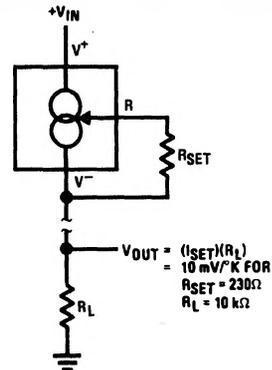

Ground Referred Fahrenheit Thermometer

TL/H/5697-15

\*Select  $R_3 = V_{REF}/583 \text{ } \mu\text{A}$ .  $V_{REF}$  may be any stable positive voltage  $\geq 2\text{V}$ . Trim  $R_3$  to calibrate.

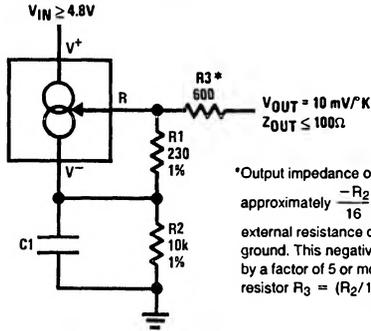

Terminating Remote Sensor for Voltage Output

TL/H/5697-14

Typical Applications (Continued)

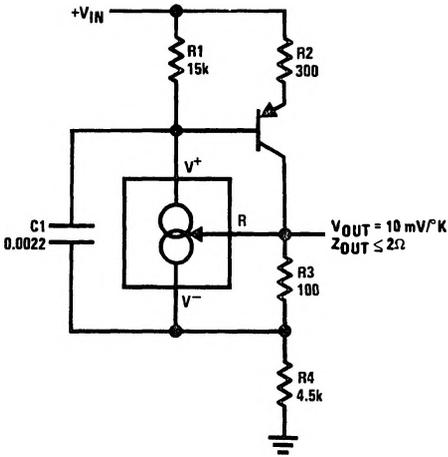

Low Output Impedance Thermometer

\*Output impedance of the LM134 at the "R" pin is approximately  $-\frac{R_2}{16}$  where  $R_2$  is the equivalent external resistance connected from the  $V^-$  pin to ground. This negative resistance can be reduced by a factor of 5 or more by inserting an equivalent resistor  $R_3 = (R_2/16)$  in series with the output.

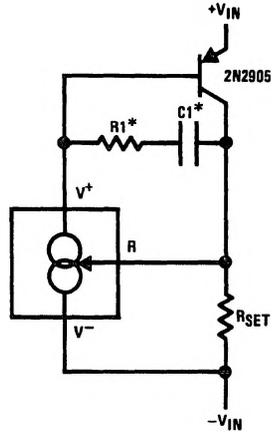

TL/H/5697-6

Low Output Impedance Thermometer

TL/H/5697-16

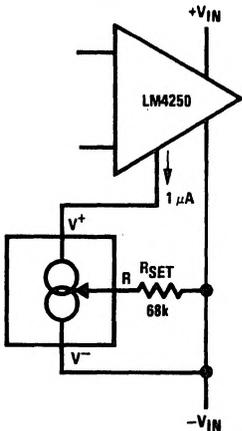

Higher Output Current

TL/H/5697-5

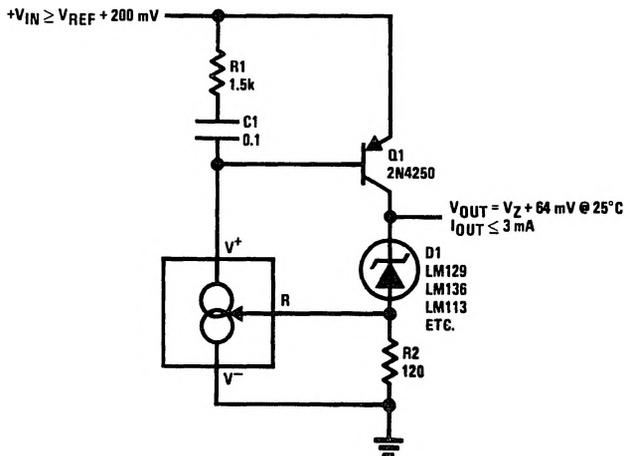

\*Select R1 and C1 for optimum stability

Micropower Bias

TL/H/5697-17

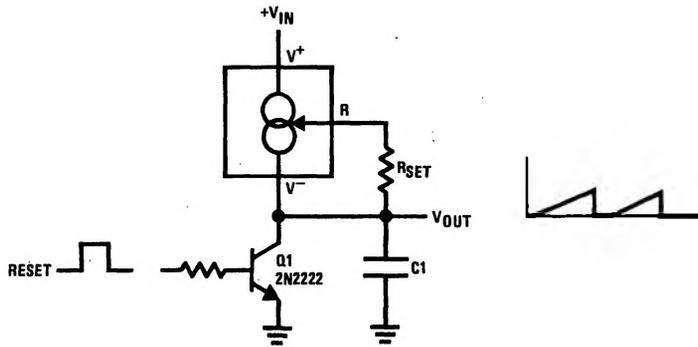

Low Input Voltage Reference Driver

TL/H/5697-18

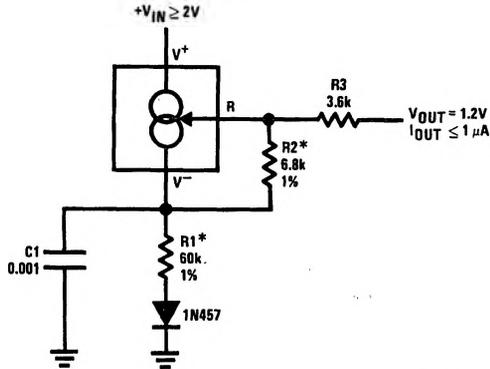

# Typical Applications (Continued)

## Ramp Generator

TL/H/5697-19

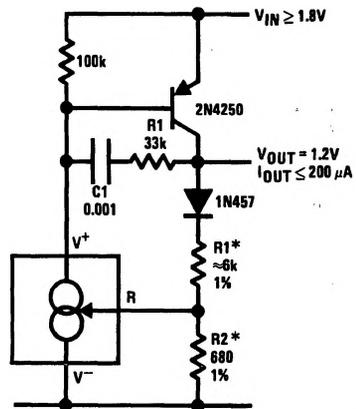

## 1.2V Reference Operates on 10 $\mu$ A and 2V

TL/H/5697-20

\*Select ratio of R1 to R2 to obtain zero temperature drift

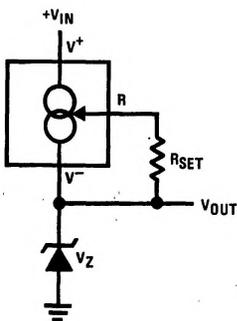

## 1.2V Regulator with 1.8V Minimum Input

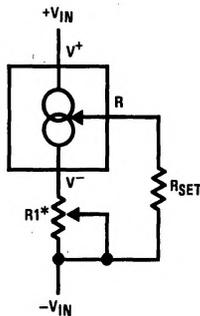

TL/H/5697-7

\*Select ratio of R1 to R2 for zero temperature drift

## Zener Blasing

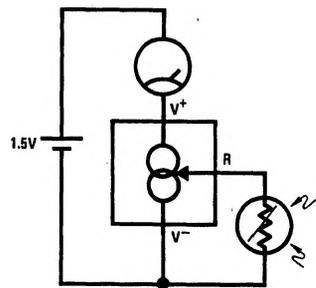

## Alternate Trimming Technique

\*For  $\pm 10\%$  adjustment, select  $R_{SET}$  10% high, and make  $R1 \approx 3 R_{SET}$

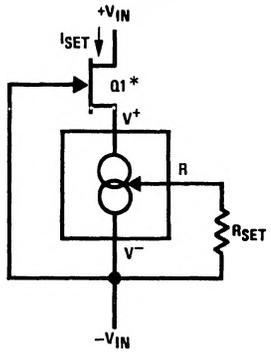

## Buffer for Photoconductive Cell

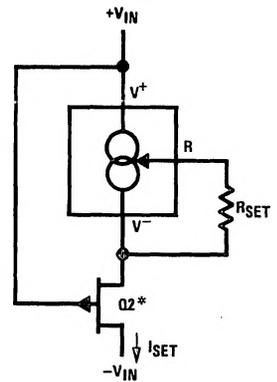

TL/H/5697-8

# Typical Applications (Continued)

## FET Cascoding for Low Capacitance and/or Ultra High Output Impedance

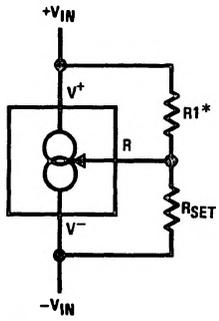

TL/H/5697-21

TL/H/5697-22

\*Select Q1 or Q2 to ensure at least 1V across the LM134.  $V_p(1 - I_{SET}/I_{DSS}) \geq 1.2V$ .

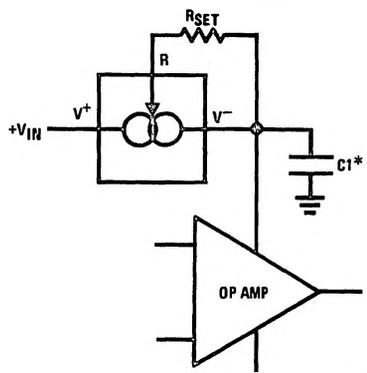

## Generating Negative Output Impedance

TL/H/5697-23

\* $Z_{OUT} \approx -16 \cdot R1$  ( $R1/V_{IN}$  must not exceed  $I_{SET}$ )

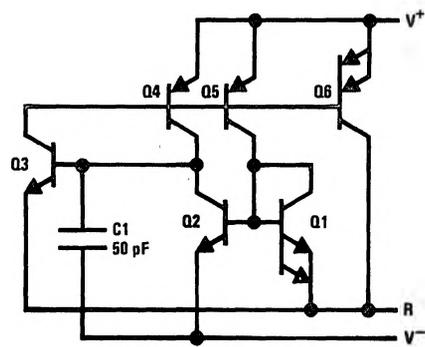

## In-Line Current Limiter

TL/H/5697-9

\*Use minimum value required to ensure stability of protected device. This minimizes inrush current to a direct short.

## Schematic Diagram

TL/H/5697-11
