

LM3940

1A Low Dropout Regulator for 5V to 3.3V Conversion

General Description

The LM3940 is a 1A low dropout regulator designed to provide 3.3V from a 5V supply.

The LM3940 is ideally suited for systems which contain both 5V and 3.3V logic, with prime power provided from a 5V bus.

Because the LM3940 is a true low dropout regulator, it can hold its 3.3V output in regulation with input voltages as low as 4.5V.

The TO-220 package of the LM3940 means that in most applications the full 1A of load current can be delivered without using an additional heatsink.

The surface mount TO-263 package uses minimum board space, and gives excellent power dissipation capability when soldered to a copper plane on the PC board.

Features

- Output voltage specified over temperature
- Excellent load regulation
- Guaranteed 1A output current
- Requires only one external component
- Built-in protection against excess temperature
- Short circuit protected

Applications

- Laptop/Desktop Computers
- Logic Systems

Connection Diagram/Ordering Information

TL/H/12080-2

3-Lead TO-220 Package (Front View)
Order Part Number LM3940IT-3.3
NSC Drawing Number TO3B

TL/H/12080-3

3-Lead TO-263 Package (Front View)
Order Part Number LM3940IS-3.3
NSC Drawing Number TS3B

Typical Application

TL/H/12080-1

*Required if regulator is located more than 1" from the power supply filter capacitor or if battery power is used.

**See Application Hints.

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Storage Temperature Range -65°C to $+150^{\circ}\text{C}$

Operating Junction Temperature Range -40°C to $+125^{\circ}\text{C}$

Lead Temperature (Soldering, 5 seconds) 260°C

Power Dissipation (Note 2) Internally Limited

Input Supply Voltage 7.5V

ESD Rating (Note 3) 2 kV

Electrical Characteristics Limits in standard typeface are for $T_J = 25^{\circ}\text{C}$, and limits in **boldface type** apply over the full operating temperature range. Unless otherwise specified: $V_{IN} = 5\text{V}$, $I_L = 1\text{A}$, $C_{OUT} = 33\text{ }\mu\text{F}$.

Symbol	Parameter	Conditions	Typical	LM3940 (Note 4)		Units
				min	max	
V_O	Output Voltage	$5\text{ mA} \leq I_L \leq 1\text{ A}$	3.3	3.20 3.13	3.40 3.47	V
$\frac{\Delta V_O}{\Delta V_I}$	Line Regulation	$I_L = 5\text{ mA}$ $4.5\text{V} \leq V_O \leq 5.5\text{V}$	20		40	mV
$\frac{\Delta V_O}{I_L}$	Load Regulation	$50\text{ mA} \leq I_L \leq 1\text{ A}$	35		50 80	
Z_O	Output Impedance	I_L (DC) = 100 mA I_L (AC) = 20 mA (rms) $f = 120\text{ Hz}$	35			m Ω
I_Q	Quiescent Current	$4.5\text{V} \leq V_{IN} \leq 5.5\text{V}$ $I_L = 5\text{ mA}$	10		15 20	mA
		$V_{IN} = 5\text{V}$ $I_L = 1\text{ A}$	110		200 250	
e_n	Output Noise Voltage	$\text{BW} = 10\text{ Hz} - 100\text{ kHz}$ $I_L = 5\text{ mA}$	150			μV (rms)
$V_O - V_{IN}$	Dropout Voltage (Note 5)	$I_L = 1\text{ A}$	0.5		0.8 1.0	V
		$I_L = 100\text{ mA}$	110		150 200	mV
$I_L(\text{SC})$	Short Circuit Current	$R_L = 0$	1.7	1.2		A

Note 1: Absolute maximum ratings indicate limits beyond which damage to the component may occur. Electrical specifications do not apply when operating the device outside of its rated operating conditions.

Note 2: The maximum allowable power dissipation is a function of the maximum junction temperature, T_J , the junction-to-ambient thermal resistance, θ_{JA} , and the ambient temperature, T_A . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. The value of θ_{JA} (for devices in still air with no heatsink) is 60°C/W for the "T" package, and 80°C/W for the "S" package. The effective value of θ_{JA} can be reduced by using a heatsink (see Application Hints for specific information on heatsinking).

Note 3: ESD rating is based on the human body model: 100 pF discharged through 1.5 k Ω .

Note 4: All limits guaranteed for $T_J = 25^{\circ}\text{C}$ are 100% tested and are used to calculate Outgoing Quality Levels. All limits at temperature extremes are guaranteed via correlation using standard Statistical Quality Control (SQC) methods.

Note 5: Dropout voltage is defined as the input-output differential voltage where the regulator output drops to a value that is 100 mV below the value that is measured at $V_{IN} = 5\text{V}$.

Typical Performance Characteristics

Application Hints

EXTERNAL CAPACITORS

The output capacitor is critical to maintaining regulator stability, and must meet the required conditions for both ESR (Equivalent Series Resistance) and minimum amount of capacitance.

MINIMUM CAPACITANCE:

The minimum output capacitance required to maintain stability is 33 μF (this value may be increased without limit). Larger values of output capacitance will give improved transient response.

ESR LIMITS:

The ESR of the output capacitor will cause loop instability if it is too high or too low. The acceptable range of ESR plotted versus load current is shown in the graph below. *It is essential that the output capacitor meet these requirements, or oscillations can result.*

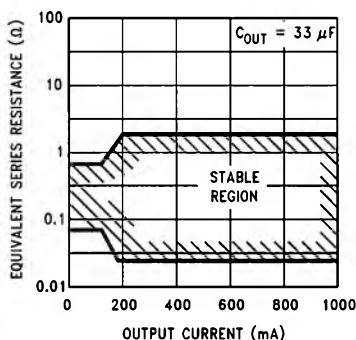

FIGURE 1. ESR Limits

It is important to note that for most capacitors, ESR is specified only at room temperature. However, the designer must ensure that the ESR will stay inside the limits shown over the entire operating temperature range for the design.

For aluminum electrolytic capacitors, ESR will increase by about 30X as the temperature is reduced from 25°C to -40°C. This type of capacitor is not well-suited for low temperature operation.

Solid tantalum capacitors have a more stable ESR over temperature, but are more expensive than aluminum electrolytics. A cost-effective approach sometimes used is to parallel an aluminum electrolytic with a solid Tantalum, with the total capacitance split about 75/25% with the Aluminum being the larger value.

If two capacitors are paralleled, the effective ESR is the parallel of the two individual values. The "flatter" ESR of the Tantalum will keep the effective ESR from rising as quickly at low temperatures.

HEATSINKING

A heatsink may be required depending on the maximum power dissipation and maximum ambient temperature of the application. Under all possible operating conditions, the junction temperature must be within the range specified under Absolute Maximum Ratings.

To determine if a heatsink is required, the power dissipated by the regulator, P_D , must be calculated.

The figure below shows the voltages and currents which are present in the circuit, as well as the formula for calculating the power dissipated in the regulator:

TL/H/12080-6

$$I_{IN} = I_L + I_G$$

$$P_D = (V_{IN} - V_{OUT}) I_L + (V_{IN}) I_G$$

FIGURE 2. Power Dissipation Diagram

The next parameter which must be calculated is the maximum allowable temperature rise, T_R (max). This is calculated by using the formula:

$$T_R (\text{max}) = T_J (\text{max}) - T_A (\text{max})$$

where: T_J (max) is the maximum allowable junction temperature, which is 125°C for commercial grade parts.

T_A (max) is the maximum ambient temperature which will be encountered in the application.

Using the calculated values for T_R (max) and P_D , the maximum allowable value for the junction-to-ambient thermal resistance, $\theta_{(J-A)}$, can now be found:

$$\theta_{(J-A)} = T_R (\text{max}) / P_D$$

IMPORTANT: If the maximum allowable value for $\theta_{(J-A)}$ is found to be $\geq 60^\circ\text{C/W}$ for the "T" package, or $\geq 80^\circ\text{C/W}$ for the "S" package, no heatsink is needed since the package alone will dissipate enough heat to satisfy these requirements.

If the calculated value for $\theta_{(J-A)}$ falls below these limits, a heatsink is required. Methods for heatsinking the TO-220 and TO-263 packages will be addressed separately:

HEATSINKING TO-220 PACKAGE PARTS

The TO-220 can be attached to a typical heatsink, or secured to a copper plane on a PC board. If a copper plane is to be used, the values of $\theta_{(J-A)}$ will be the same as shown in the next section for the TO-263.

If a manufactured heatsink is to be selected, the value of heatsink-to-ambient thermal resistance, $\theta_{(H-A)}$, must first be calculated:

$$\theta_{(H-A)} = \theta_{(J-A)} - \theta_{(C-H)} - \theta_{(J-C)}$$

Where: $\theta_{(J-C)}$ is defined as the thermal resistance from the junction to the surface of the case. A value of 4°C/W can be assumed for $\theta_{(J-C)}$ for this calculation.

$\theta_{(C-H)}$ is defined as the thermal resistance between the case and the surface of the heatsink. The value of $\theta_{(C-H)}$ will vary from about 1.5°C/W to about 2.5°C/W (depending on method of attachment, insulator, etc.). If the exact value is unknown, 2°C/W should be assumed for $\theta_{(C-H)}$.

Application Hints (Continued)

When a value for $\theta_{(H-A)}$ is found using the equation shown, a heatsink must be selected that has a value that is less than or equal to this number.

$\theta_{(H-A)}$ is specified numerically by the heatsink manufacturer in the catalog, or shown in a curve that plots temperature rise vs power dissipation for the heatsink.

HEATSINKING TO-263 PACKAGE PARTS

Heat is conducted away from the TO-263 by soldering the tab of the device to a copper plane on the PC board.

The graph below shows the measured values of $\theta_{(J-A)}$ for different copper area sizes using a typical P.C. board with 1 ounce copper and no solder mask over the copper area used for heatsinking:

FIGURE 3. $\theta_{(J-A)}$ vs Copper Area

TL/H/12080-7

As shown in the figure, increasing the copper area beyond 1 square inch produces very little improvement. It should also be observed that the minimum value of $\theta_{(J-A)}$ for the TO-263 package mounted to a P.C. board is $32^{\circ}\text{C}/\text{W}$.

As a design aid, a plot is shown below which illustrates the maximum allowable power dissipation compared to ambient temperature for the TO-263 device (assuming $\theta_{(J-A)}$ is $35^{\circ}\text{C}/\text{W}$ and the maximum junction temperature is 125°C):
