

LMK04610 Ultra-Low Noise and Low Power JESD204B Compliant Clock Jitter Cleaner With Dual Loop PLLs

1 Features

- Dual Loop PLL Architecture
 - 65-fs RMS Jitter (10 kHz to 20 MHz)
 - 85-fs RMS Jitter (100 Hz to 20 MHz)
 - –165-dBc/Hz Noise Floor at 122.88 MHz
- JESD204B Support
 - Single Shot, Pulsed, and Continuous SYSREF
- 10 Differential Output Clocks in 8 Frequency Groups
 - Programmable Output Swing Between 700 mVpp to 1600 mVpp
 - Each Output Pair Can be Configured to SYSREF Clock Output
 - 16-Bit Channel Divider
 - Minimum SYSREF Frequency of 25 kHz
 - Maximum Output Frequency of 2 GHz
 - Precision Digital Delay, Dynamically Adjustable
 - Digital Delay (DDL) of $\frac{1}{2} \times$ Clock Distribution Path Frequency (2 GHz Maximum)
 - 60-ps Step Analog Delay
 - 50% Duty Cycle Output Divides, 1 to 65535 (Even and Odd)
- 2 Reference Inputs
 - Holdover Mode, When Inputs are Lost
 - Automatic and Manual Switch-Over Modes
 - Loss-of-Signal (LOS) Detection
- 0.88-W Typical Power Consumption With 10 Outputs Active
- Operates Typically From a 1.8-V (Outputs, Inputs) and 3.3-V Supply (Digital, PLL1, PLL2_OSC, PLL2 Core)
- Fully Integrated Programmable Loop Filter
- PLL2
 - PLL2 Phase Detector Rate Up to 250 MHz
 - OSCin Frequency-Doubler
 - Integrated Low-Noise VCO
- Internal Power Conditioning: Better Than –80dBc

PSRR on VDDO for 122.88-MHz Differential Outputs

- 3- or 4-Wire SPI Interface (4-Wire is Default)
- –40°C to +85°C Industrial Ambient Temperature
- Supports 105°C PCB Temperature (Measured at Thermal Pad)
- LMK04610: 8-mm × 8-mm VQFN-56 Package With 0.5-mm Pitch

2 Applications

- Wireless Infrastructure Like LTE-BTS, Small Cells, Remote Radio Units (RRU)
- Data Converter and Integrated Transceiver Clocking
- Networking, SONET/SDH, DSLAM
- Test and Measurement

3 Description

The LMK0461x device family is the industry's highest performance and lowest power jitter cleaner with JESD204B support.

4 Revision History

Changes from Original (January 2017) to Revision A

Page

Removed the 16 differential output clock and 6 frequency group features from the LMK04610	1
Removed the 4 reference input feature from the LMK04610	1
Changed text from: –70-dBc PSRR to: –80dBc PSRR on VDDO	1
Changed SPI Interface default from: 3-wire to: 4-wire	1
Changed VCO frequency from: 5.8 to 6.2 GHz to: 5.8 to 6.175 GHz	1
Changed VCO frequency from: 6200 MHz to: 6175 MHz	3
Updated PLL1_CAP pin description	4
Removed tablenote from the doubler input frequency parameter	9
Changed VCO tuning range maximum from: 6200 to: 6175	9
Changed tablenote text from: ATE tested at 2949.12 MHz to: ATE tested at 258 MHz	9
Removed the CLKin2/CLKin2*, and CLKin3/CLKin3* inputs from the LMK04610	20
Updated the <i>Functional Block Diagram</i>	22
Added content to the <i>Driving CLKin and OSCin Pins With a Differential Source</i> section	26
Changed text from: Either AC coupling or DC coupling may be used. to: The clock is internally AC-coupled	27
Updated Figure 36	35
Changed the tuning range of the oscillator from: 6200 MHz to: 6175 MHz	38

V _{IN_} gpio	Input voltage for digital and status pins (CLKin_SEL, SCK, SDIO, SCS*, STATUSx, SYNC, RESETN)	−0.3	2.1	V
T _L	Lead temperature (solder 4 s)		+260	°C
T _J	Junction temperature		125	°C
I _{IN}	Input current		20	mA
MSL	Moisture sensitivity level		3	
T _{stg}	Storage temperature	−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Stresses in excess of the absolute maximum ratings can cause permanent or latent damage to the device. These are absolute stress ratings only. Functional operation of the device is only implied at these or any other conditions in excess of those given in the operation sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.
- (3) Never to exceed 3.6 V.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge ⁽¹⁾	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽²⁾	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽³⁾	±250
		Machine model	±150

- (1) This device is a high performance RF integrated circuit with an ESD rating up to 2-kV human-body model, up to 150-V machine model, and up to 250-V charged-device model and is ESD sensitive. Handling and assembly of this device should only be done at ESD-free workstations.
- (2) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (3) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T _J	Junction temperature			125	°C
T _A	Ambient temperature	–40	25	85	°C
T _{PCB}	PCB temperature (measured at thermal pad)			105	°C
VDD_IO	Supply voltage for input	1.7	1.8	3.465	V
VDD_CORE	Supply voltage for digital	3.135	3.3	3.465	V
VDD_PLL1	Supply voltage for PLL1	3.135	3.3	3.465	V
VDD_PLL2CORE	Supply voltage for PLL2 Core	3.135	3.3	3.465	V
VDD_PLL2OSC	Supply voltage for PLL2 OSC	3.135	3.3	3.465	V
VDD_OSC	Supply voltage for OSCout	1.7	1.8	3.465	V
VDDO_x	Supply voltage for CLKoutX	1.7	1.8	3.465	V

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LMK04610	UNIT
		RTQ (VQFN)	
		56 PINS	
R _{θJA}	Junction-to-ambient thermal resistance ⁽²⁾	26.2	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance ⁽³⁾	12.3	°C/W
R _{θJB}	Junction-to-board thermal resistance ⁽⁴⁾	4.6	°C/W
Ψ _{JT}	Junction-to-top characterization parameter ⁽⁵⁾	0.2	°C/W
Ψ _{JB}	Junction-to-board characterization parameter ⁽⁶⁾	4.6	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance ⁽⁷⁾	0.8	°C/W

- (1) For more information about traditional and new thermal metrics, see the [IC Package Thermal Metrics](#) application report.
- (2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, High-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (3) The junction-to-case(top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (5) The junction-to-top characterization parameter, Ψ_{JT}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining R_{θJA}, using a procedure described in JESD51-2a (sections 6 and 7).
- (6) The junction-to-board characterization parameter, Ψ_{JB}, estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining R_{θJA}, using a procedure described in JESD51-2a (sections 6 and 7).
- (7) The junction-to-case(bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

7.5 Digital Input and Output Characteristics (CLKin_SEL, STATUSx, SYNC, RESETN)

(1) See [Driving CLKin and OSCin Pins With a Single-Ended Source](#).

(2) See [Driving CLKin and OSCin Pins With a Differential Source](#).

(3) To meet the jitter performance listed in the subsequent sections of this data sheet, the minimum recommended differential slew rate for all input clocks is 3 V/ns; this is especially true for single-ended clocks. Phase noise performance begins to degrade as the clock input slew rate is reduced. However, the device functions at slew rates down to the minimum listed. When compared to single-ended clocks, differential clocks (LVDS, LVPECL) are less susceptible to degradation in phase noise performance at lower slew rates due to their common mode noise rejection. However, TI also recommends using the highest possible slew rate for differential clocks to achieve optimal phase noise performance at the device outputs.

PFD _{spur}	PLL1 PFD update spur	Measured with PLL1 only. PLL1 Bandwidth set to 50 Hz. PLL1 PFD update frequency 1 MHz.		–150	–100	dBc/Hz

- (1) A specification in modeling PLL in-band phase noise is the 1/f flicker noise, $L_{\text{PLL_flicker}}(f)$, which is dominant close to the carrier. Flicker noise has a 10 dB/decade slope. PN10kHz is normalized to a 10-kHz offset and a 1-GHz carrier frequency. $\text{PN10kHz} = L_{\text{PLL_flicker}}(10 \text{ kHz}) - 20\log(F_{\text{out}} / 1 \text{ GHz})$, where $L_{\text{PLL_flicker}}(f)$ is the single side band phase noise of only the flicker noise's contribution to total noise, $L(f)$. To measure $L_{\text{PLL_flicker}}(f)$ it is important to be on the 10 dB/decade slope close to the carrier. A high compare frequency and a clean crystal are important to isolating this noise source from the total phase noise, $L(f)$. $L_{\text{PLL_flicker}}(f)$ can be masked by the reference oscillator performance if a low power or noisy source is used. The total PLL in-band phase noise performance is the sum of $L_{\text{PLL_flicker}}(f)$ and $L_{\text{PLL_flat}}(f)$.

- (1) The EN_PLL2_REF_2X bit enables/disables a frequency doubler mode for the PLL2 OSCin path.
- (2) Assured by characterization. ATE tested at 258 MHz.
- (3) A specification in modeling PLL in-band phase noise is the 1/f flicker noise, $L_{\text{PLL_flicker}}(f)$, which is dominant close to the carrier. Flicker noise has a 10 dB/decade slope. PN10kHz is normalized to a 10-kHz offset and a 1-GHz carrier frequency. $\text{PN10kHz} = L_{\text{PLL_flicker}}(10 \text{ kHz}) - 20\log(F_{\text{out}} / 1 \text{ GHz})$, where $L_{\text{PLL_flicker}}(f)$ is the single side band phase noise of only the flicker noise's contribution to total noise, $L(f)$. To measure $L_{\text{PLL_flicker}}(f)$ it is important to be on the 10 dB/decade slope close to the carrier. A high compare frequency and a clean crystal are important to isolating this noise source from the total phase noise, $L(f)$. $L_{\text{PLL_flicker}}(f)$ can be masked by the reference oscillator performance if a low power or noisy source is used. The total PLL in-band phase noise performance is the sum of $L_{\text{PLL_flicker}}(f)$ and $L_{\text{PLL_flat}}(f)$.
- (4) Maximum Allowable Temperature Drift for Continuous Lock is how far the temperature can drift in either direction from the value and still have the part stay in lock; this implies the part will work over the entire frequency range. However, if the temperature drifts more than the maximum allowable drift for continuous lock, it will be necessary to reload the appropriate register to ensure it stays in lock. Regardless of what temperature the part was initially programmed at, the temperature must never drift outside the frequency range of -40°C to 105°C without violating specifications.

7.19 Timing Diagram

Each serial interface access cycle is exactly $(2 + N)$ bytes long, where N is the number of data bytes. A frame is initiated by asserting SCS* low. The frame ends when SCS* is de-asserted high. The first bit transferred is the R/W bit. The next 15 bits are the register address and the remaining bits are data. For all writes, data is committed in bytes as the 8th data bit of a data field is clocked in on the rising edge of SCL. If the write access is not an even multiple of 8 clocks, the trailing data bits are not committed. On read access, data is clocked out on the falling edge of SCL on the SDO pin.

Four-wire mode read back has the same timing as the SDIO pin.

R/W bit = 0 is for SPI write. R/W bit = 1 is for SPI read.

See [Programming](#) for more details.

8 Parameter Measurement Information

8.1 Differential Voltage Measurement Terminology

The differential voltage of a differential signal can be described by two different definitions, causing confusion when reading data sheets or communicating with other engineers. This section addresses the measurement and description of a differential signal so the reader is able to understand and distinguish between the two different definitions when used.

The first definition used to describe a differential signal is the absolute value of the voltage potential between the inverting and noninverting signal. The symbol for this first measurement is typically V_{ID} or V_{OD} , depending on if an input or output voltage is being described.

The second definition used to describe a differential signal is to measure the potential of the noninverting signal with respect to the inverting signal. The symbol for this second measurement is V_{SS} and is a calculated parameter; this signal does not exist in the IC with respect to ground, it only exists in reference to its differential pair. V_{SS} can be measured directly by oscilloscopes with floating references, otherwise this value can be calculated as twice the value of V_{OD} as described in the first description.

Figure 9 illustrates the two different definitions side-by-side for inputs and Figure 10 illustrates the two different definitions side-by-side for outputs. The V_{ID} and V_{OD} definitions show V_A and V_B DC levels that the noninverting and inverting signals toggle between with respect to ground. V_{SS} input and output definitions show that if the inverting signal is considered the voltage potential reference, the noninverting signal voltage potential is now increasing and decreasing above and below the noninverting reference. Thus the peak-to-peak voltage of the differential signal can be measured.

V_{ID} and V_{OD} are often defined as volts (V) and V_{SS} is often defined as volts peak-to-peak (V_{PP}).

9 Detailed Description

9.1 Overview

The LMK04610 device is very flexible in meeting many application requirements. The typical use case for LMK04610 is a cascaded Dual Loop Jitter Cleaner with optional support for JESD204B.

NOTE

While the Clock outputs (CLKoutX) do not provide LVCMOS outputs, the OSCout may be used to provide LVCMOS outputs.

In addition to dual-loop operation, by powering down various blocks, the LMK04610 may be configured for single-loop or clock distribution modes also.

9.1.1 Jitter Cleaning

The dual-loop PLL architecture of LMK04610 provides the lowest jitter performance over a wide range of output frequencies and phase noise integration bandwidths. The first stage PLL (PLL1) is driven by an external reference clock and uses an external VCXO to provide a frequency accurate, low phase noise reference clock for the second stage frequency multiplication PLL (PLL2).

PLL1 typically uses a narrow loop bandwidth (typically 10 Hz to 200 Hz) to retain the frequency accuracy of the reference clock input signal while simultaneously suppressing the higher offset frequency phase noise that the reference clock may have accumulated along its path or from other circuits. This *cleaned* reference clock provides the reference input to PLL2.

The low phase noise reference provided to PLL2 allows PLL2 to operate with a wide loop bandwidth (typically 90 kHz to 500 kHz). The loop bandwidth for PLL2 is chosen to take advantage of the superior high offset frequency phase noise profile of the internal VCO and the good low offset frequency phase noise of the reference VCXO.

Ultra-low jitter is achieved by allowing the external VCXO phase noise to dominate the final output phase noise at low offset frequencies and the internal VCO's phase noise to dominate the final output phase noise at high offset frequencies. This results in best overall phase noise and jitter performance.

9.1.2 Two Redundant Reference Inputs (CLKin0/CLKin0*, CLKin1/CLKin1*)

The LMK04610 has two reference clock inputs for PLL1. They are CLKin0, CLKin1. The active clock is chosen based on CLKin_SEL_MODE. Automatic or manual switching can occur between the inputs.

Fast manual switching between CLKin0 and CLKin1 reference clocks is possible with external pin CLKin_SEL.

9.1.3 VCXO Buffered Output

The LMK04610 provides OSCout, which by default is a buffered copy of the PLL1 feedback or PLL2 reference input. This reference input is typically a low noise VCXO. This output can be used to clock external devices such as microcontrollers, FPGAs, CPLDs, and so forth, before the LMK04610 is programmed.

The OSCout buffer output types are LVCMOS, HSDS, and HCSL.

On top of that, OSCout has the option to fan out a copy of PLL2 output.

9.1.4 Frequency Holdover

LMK04610 supports holdover operation for PLL1 to keep the clock outputs on frequency with minimum drift when the reference is lost until a valid reference clock signal is re-established.

9.1.5 Integrated Programmable PLL1 and PLL2 Loop Filter

LMK04610 features programmable loop filter for PLL1 and PLL2. See [PLL1 and PLL2](#).

Overview (continued)

9.1.6 Internal VCOs

LMK04610 has an internal VCO in PLL2 with 5.8- to 6.2-GHz tuning range. The output of the VCO is routed through a mandatory divider (by 3, by 4, by 5, or by 6) to the Clock Distribution Path. This limits the Clock Distribution Path frequency to 2.067 GHz. This same clock is also fed back to the PLL2 phase detector through the N-divider (feedback divider).

9.1.7 Clock Distribution

The LMK04610 features a total of 10 PLL2 clock outputs driven from one of the internal VCOs.

All PLL2 clock outputs have programmable output types. They can be programmed to HSDS or HCSL.

If OSCout is included in the total number of clock outputs the LMK04610 is able to distribute up to 11 differential clocks.

The following sections discuss specific features of the clock distribution channels that allow the user to control various aspects of the output clocks.

9.1.7.1 Output Clock Divider

The output divider supports a divide range of 1 to 65535 (even and odd) with 50% output duty cycle.

9.1.7.2 Output Clock Delay

The clocks include both an analog and digital delay for phase adjustment of the clock outputs.

The analog delay allows a nominal 60-ps step size and range from 0 to 1.2 ns of total delay per output. See [Analog Delay](#) for further information.

The digital delay allows an output channel to be delayed from 1 to 255 VCO cycles. The delay step can be as small as half the period of the clock distribution path. For example, 1.5-GHz clock distribution path frequency results in 333-ps coarse tuning steps. The coarse (digital) delay value takes effect on the clock outputs after a SYNC event. See [Digital Delay](#) for further information.

1. Fixed Digital Delay (per output channel) – Allows all the output channels to have a known phase relationship upon a SYNC event. Typically performed at start-up.
2. Dynamic Digital Delay (per output) – Allows additional coarse adjustment per output.

9.1.7.3 Glitchless Half-Step and Glitchless Analog Delay

The device clocks include a features to ensure glitchless operation of the Half-Step and analog delay operations when enabled.

9.1.7.4 Programmable Output Formats

All LMK0461x clock outputs (CLKoutX) can be programmed to an HSDS or HCSL output type. The OSCout can be programmed to an HSDS, HCSL, or LVCMOS output type.

Any HSDS output type can be programmed to typical 800-, 1200-, or 1600-mVpp differential amplitude levels.

9.1.7.5 Clock Output SYNChronization

Using the SYNC input causes all active clock outputs to share a rising edge as programmed by fixed digital delay.

The SYNC event must occur for digital delay values to take effect.

9.1.8 Status Pins

The LMK0461x provides status pins that can be monitored for feedback or in some cases used for input, depending upon device programming. For example:

- Indication of the loss-of signal (LOS) for CLKinX.
- Indication of the selected active clock input.
- PLL1 and PLL2 lock signal.

9.3 Feature Description

9.3.1 Reference Inputs (CLKin0/CLKin0*, CLKin1/CLKin1*)

Figure 15. LMK04610 Clock Input Block

9.3.1.1 Input Clock Switching

Manual, pin select, and priority or automatic are three different kinds clock input switching modes can be set with the CLKIN_SEL_MODE register.

Below is information about how the active input clock is selected and what causes a switching event in the various clock input selection modes.

9.3.1.1.1 Input Clock Switching – Register Select Mode

When CLKIN_SEL_MODE = 2, then CLKin0 or CLKin1 is selected through register control (SW_REFINSEL[3:0]).

If holdover is entered in this mode, then the device relocks to the selected CLKin upon holdover exit.

Table 2. Active Clock Input – Register Select Mode (SW_REFINSEL[3:0])

SW_REFINSEL[3:0]	ACTIVE CLOCK (LMK04610)
0100b	CLKin0
1000b	CLKin1

9.3.1.1.2 Input Clock Switching – Pin Select Mode (CLKin_SEL)

When CLKIN_SEL_MODE = 1, the pin CLKin_SEL selects which clock input is active.

Configuring Pin Select Mode

The polarity of CLKin_SEL input pin can be inverted with the CLKinSEL1_INV bit.

Table 3 defines which input clock is active depending on CLKin_SEL state.

Table 3. Active Clock Input – Pin Select Mode (CLKin_SEL), CLKinSEL_INV = 0

PIN CLKin_SEL	ACTIVE CLOCK
Low	CLKin0
High	CLKin1

9.3.1.1.3 Input Clock Switching – Automatic Mode

When CLKINSEL1_MODE = 0, the input clock switching is in automatic mode. The priority of each input clock can be individually set by programming CLKINx_PRIO[1:0] as shown in [Table 4](#):

Table 4. Clock Input Priority Selection

CLKINx_PRIO[1:0]	CLKINx
00b	Disabled
01b	Priority 1 (Highest)
10b	Priority 2 (Lowest)

NOTE

Equal priority setting for two CLKINx inputs are not allowed.

The clock inputs in this mode are monitored by on-chip LOS detection circuits. The device reads the priority bits at start-up and locks to the input clock with highest priority. In the event of input clock loss, the internal PLL switches to the next available clock. TI recommends using holdover mode while using the automatic reference clock switching. See [Holdover](#) for programming the holdover mode.

In this case, the outputs clocks see minimum disturbance while switching from one clock to the other. In the event of reference clock loss, the PLL1 enters the holdover mode. After the internal logic switches the PLL1 input clock to the next available clock as per priority setting, PLL1 holdover exit is initiated and PLL1 relocks to the new clock with minimum disturbance. [Figure 16](#) describes the sequence of operations in the automatic reference clock switching mode while holdover is enabled and programmed.

Figure 16. Input Clock Switching – Priority Loop

9.3.1.2 Loss of Signal Detection – LOS

The loss of signal detection circuit is available for all clock inputs. It has programmable assertion and de-assertion cycles. LOS detection circuit reliable operation is ensured with >200-mVpp differential or >200-mV single-ended CLKIn amplitude and input frequencies between 10 MHz to 500 MHz. Maximum input frequency for the doubler in the LOS block is 250 MHz. The ratio between VCXO frequency and input frequency must be between 0.25 and 4.

9.3.1.2.1 LOS – Assertion

LOS assertion time is programmable between 1 to 8 VCXO clock cycles. The LOS assertion time is programmed through CLKINx_LOS_LAT_SEL[7:0]. LOS_LAT_SEL is an 8-Bit code. Additionally, CLKINx_LOS_FRQ_DBL_EN bit controls the frequency doubler for the LOS block. This is especially important for VCXO frequencies equal or smaller than CLKInX frequency.

For correct operation of LOS, the reference clock must be switched to logic low level (differential or single-ended).

Figure 17. LOS Detection

Table 5. Recommended LOS Register Configurations

CLKIn TO OSCIn FREQUENCY RATIO	LOS_LAT_SEL	LOS_FRQ_DBL_EN	MAX LOS DETECTION LATENCY IN CLKIn CYCLES

9.3.1.2.2 LOS – Reference Clock Recovery

LOS de-assertion can be programmed to 15 to 4095 reference clock cycles (CLKINx_LOS_REC_CNT[7:0]).

9.3.1.3 Driving CLKin and OSCin Inputs

9.3.1.3.1 Driving CLKin and OSCin Pins With a Differential Source

The CLKin ports and OSCin can be driven by differential signals. TI recommends setting the input mode to differential (CLKINX_SE_MODE = 0) when using differential reference clocks. The LMK0461x internally AC couples the inputs. An optional AC-coupling cap can be connected as shown in input termination sachems. The recommended circuits for driving the CLKin or OSCin pins with either LVDS or LVPECL are shown in Figure 19 and Figure 20.

Also, a reference clock source can produce a differential sine wave output can drive the CLKin pins using Figure 21.

NOTE

The signal level must conform to the requirements for the CLKin pins listed in [Clock Input Characteristics \(CLKinX\)](#). CLKINX_SE_MODE is recommended to be set to differential mode (CLKINX_SE_MODE = 0).

Figure 21. CLKinX/X* Termination for a Differential Sinewave Reference Clock Source

9.3.1.3.2 Driving CLKin and OSCin Pins With a Single-Ended Source

The CLKin pins of the LMK0461x family can be driven using a single-ended reference clock source, like a sine wave source or an LVCMOS or LVTTL source. The clock is internally AC-coupled.. In the case of the sine wave source that is expecting a 50-Ω load, TI recommends using AC coupling as shown in Figure 22 with a 50-Ω termination.

NOTE

The signal level must conform to the requirements for the CLKin pins listed in [Clock Input Characteristics \(CLKinX\)](#). CLKINX_SE_MODE is recommended to be set to single-ended mode (CLKINX_SE_MODE = 1).

Copyright © 2017, Texas Instruments Incorporated

Figure 22. CLKinX/X* and OSCin AC-Coupled Single-Ended Termination

If the CLKin pins are being driven with a single-ended LVCMOS or LVTTL source, either DC coupling or AC coupling may be used. If DC coupling is used, the CLKINX_SE_MODE should be set to single-ended buffer mode (CLKINX_SE_MODE = 1) and the voltage swing of the source must meet the specifications for DC-coupled, single-ended mode clock inputs given in [Clock Input Characteristics \(CLKinX\)](#). If AC coupling is used, the CLKINX_SE_MODE should be set to the differential buffer mode (CLKINX_SE_MODE = 0). The voltage swing at the input pins must meet the specifications for AC-coupled, differential mode clock inputs given in [Clock Input Characteristics \(CLKinX\)](#). In this case, some attenuation of the clock input level may be required. A simple resistive divider circuit before the AC-coupling capacitor is sufficient.

9.3.2.1 HCSL

Figure 25 shows a typical implementation for the HCSL output driver mode. HCSL requires external 50-Ω termination resistors. Optionally, source resistors in the range from 22 Ω to 33 Ω are employed to eliminate ringing.

For HCSL outputs, set OUTCHxx_DRIV_MODE to 0x3F.

9.3.2.2 HSDS

HSDS does not need external output termination (see [Figure 28](#)).

For HSDS: 8-mA outputs set OUTCHxx_DRIV_MODE to 0x18.

For HSDS: 6-mA outputs set OUTCHxx_DRIV_MODE to 0x14.

For HSDS: 4-mA outputs set OUTCHxx_DRIV_MODE to 0x10.

9.3.2.3 SYNC

See additional information about the SYNC pin in [STATUS0/1 and SYNC Pin Functions](#).

SYNC aligns all clock outputs to start at a common rising clock distribution path clock edge. Clocks divided by 1 or divider bypass are not gated during the SYNC event.

SYNC is not available in buffer mode.

Figure 32. SYNC Example

9.3.2.4 Digital Delay

Digital (coarse) delay allows an output to be delayed by 1 to 255 periods of the clock distribution path frequency. The delay step can be as small as half the period of the clock distribution path frequency by using the HS_EN_CHx bit.

The digital delay step size calculates with: $1 / \text{VCO frequency} / \text{prescaler}$

1. Fixed digital delay (per output channel)
2. Dynamic digital delay (per output)

9.3.2.4.1 Fixed Digital Delay

Fixed digital delay value takes effect on the clock outputs after a SYNC event. As such, the outputs are LOW for a while during the SYNC event. Applications that cannot accept clock breakup when adjusting digital delay should use dynamic digital delay.

9.3.2.4.2 Dynamic Digital Delay

Additionally, for the fixed digital delay per output channel, each output can be individually delayed using dynamic digital delay. Up to 5 periods of the clock distribution path frequency can be shifted.

The setting applies without SYNC to the output.

9.3.3 OSCout

The default function for OSCout is providing two buffered LVCMOS copies (in phase or complementary) of the external VCXO. Additionally, an 8-bit divider is integrated. The multiplexer selects the VCXO input or high-speed clock distribution tree. The output type can be programmed to HSDS, HCSL, and LVCMOS. See [Output Termination Scheme](#) for test load descriptions.

9.3.5 PLL1 and PLL2

LMK0461x has two programmable PLLs. PLL1 is a very low bandwidth PLL with an external VCXO. The bandwidth of the PLL1 can be programmed from 3 Hz to 300 Hz. PLL2 is a high bandwidth PLL using an on-chip, very low phase noise LC VCO. PLL2 bandwidth can be programmed from 90 KHz to 1 MHz. The detailed description about the individual PLLs is provided in the following sections.

9.3.5.1 PLL1

PLL1 in LMK0461x is a very low bandwidth PLL. The PLL is a fully programmable, ultra-flexible design and is intended to be used for jitter cleaning of the noisy input clock. The PLL uses a semi-digital architecture and there is no need for external loop filter. The loop-filter has separated integral and proportional paths, which can be programmed individually to define the PLL transfer. There is a possibility to add higher order poles by connecting a capacitor outside the chip with a fixed on-chip resistor R_{CTRL} . The block diagram of the PLL1 is shown in [Figure 36](#). The PLL uses an external VCXO as a voltage controlled oscillator. Both positive and negative gain VCXOs are supported by LMK046xx.

Figure 36. PLL1 Block Diagram

To reduce lock time, PLL1 supports two locking modes which can be individually configured by the user. When configured, PLL1 starts with Fastlock (with very high integral gain) and after lock, it switches to desired integral gain.

PLL1 Bandwidth depends on the VCXO gain and loop parameters. LMK0461x PLLs are designed with *active damping* technique. For a given VCXO gain and divider settings, the bandwidth can be programmed by using the PLL1_PROP settings. The higher the value, the higher the bandwidth.

Table 13 shows the internal PLL1 parameter, register and programming ranges.

Table 13. PLL1 Parameter and Register

PARAMETER	REGISTER	DESCRIPTION	MIN	TYP	MAX	UNIT
CLKINx_PLL1_RDIV	0x1B,0x1C,0x1D,0x1E,0x1F,0x20,0x21,0x22	Input clock divider for PLL1	1		32771	
PLL1_NDIV	0x61,0x62	Feedback clock divider for PLL1	1		32771

PLL1_INTG_FL	0x59	Integral gain setting for Fast Lock	0	15	15	
R_CTRL				500		Ω

9.3.5.1.1 PLL1 Proportional Modes

PLL1 bandwidth can be increased or decreased even further by using the different PROP modes (see Table 14).

Table 14. PLL1 Proportional Modes

PROP MODE	REGISTER SETTINGS	DUTY CYCLE OF CLOCK
Default	PLL1_RDIV_4CY = 0 PLL1_NDIV_4CY = 0	50%
Low Pulse mode	PLL1_RDIV_4CY = 1 PLL1_NDIV_4CY = 1 PLL1_FBCLK_INV=0 CLKINx_PLL1_INV=0	(4/DIV) *100
High Pulse mode	PLL1_RDIV_4CY = 1 PLL1_NDIV_4CY = 1 PLL1_FBCLK_INV=1 CLKINx_PLL1_INV=1	(1-4/DIV) *100

In the default input mode, the proportional is effective for 50% of the PFD clock period. Using *low pulse mode*, the effect of the proportional is reduced which results in a reduced PLL bandwidth. Similarly, using the *high pulse mode*, the proportional is effective for more than half of the PFD cycle, which results in higher bandwidth.

PLL1_INTG settings affect the integral gain in the loop. TI recommends using setting 0 in normal mode and higher settings only for Fast lock using PLL1_INTG_FL.

9.3.5.1.2 PLL1 Higher Order Poles

There are no external resistors and capacitors required for the low bandwidth PLL1. However, to introduce 3rd order pole in the loop, external capacitor C3 can be attached to the control voltage, which in combination with the on-chip resistor, creates a pole at the desired frequency. Higher order poles can also be introduced using external resistors and capacitors like in standard analog PLLs as shown in Figure 37.

Figure 37. 3rd Order Loop Filter

Figure 38. Higher Order Loop Filter

9.3.5.1.3 Examples of PLL1 Setting

This section shows PLL1 setting examples to generate given loop bandwidth.

122.88 MHz	30.72 MHz	100	25	Low-Pulse Mode	10	0	4.7 μF

9.3.5.2 PLL2

The second PLL in LMK046xx is a high bandwidth PLL requiring no external components. The PLL contains a very low phase noise on chip LC-based Voltage controlled oscillator (VCO). The VCO is very flexible and full programmable. Similar to PLL1, PLL2 is also a semi-digital PLL designed with an *active damping* concept. The bandwidth of the PLL can be programmed between 90 kHz to 1 MHz. PLL2 also has separated integral and proportional paths to control the VCO. The 3rd order pole can also be introduced by selecting the integrated resistors and capacitors.

The input clock frequency to the PLL2 can be doubled by using an integrated frequency doubler. Apart from that there are additional input modes possible to have more flexibility for bandwidth programming.

Figure 39. PLL2 Block Diagram

9.3.5.2.1 PLL2 Divider

PLL2 contains three dividers. Input clock can be divided down by using reference divider (PLL2_RDIV). Second divider is the high-frequency prescaler at the output of the VCO. Third divider is in the PLL feedback path which defines the PLL frequency multiplication ratio in combination with prescaler. Each of the three dividers is programmable with the registers as described in [Table 16](#).

Table 16. PLL2 Divider

PARAMETER	REGISTER	DESCRIPTION	MIN	TYP	MAX	UNIT
PLL2_RDIV	0x76	Input clock divider for PLL2	1		31	
PLL2_NDIV	0x73, 0x74	Feedback clock divider for PLL2	1		65535	
PLL2_PRESCALER	0x146	The prescaler defines the Clock Distribution Frequency.	3		6	

9.3.5.2.2 PLL2 Input Modes

PLL2 has four input modes which can be selected by the user. These modes give more flexibility to adjust the PLL2 bandwidth. See [Table 17](#).

Table 17. PLL2 Input Modes

INPUT MODE	DESCRIPTION
Doubler Mode	The Input clock gets multiplied by 2. The duty cycle of the clock is <50%.
Doubler invert mode	This mode is same like the doubler mode, where the input clock gets multiplied by 2, but the duty cycle of the output clock is >50%.
Pulse mode	The duty cycle of the input clock is adjusted to a fixed value and is >50%.
RDIV mode	The input divider is used to divide down the frequency with the range as shown in Table 16 .

9.3.5.2.3 PLL2 Loop Filter

PLL2 design is based on semi-digital PLL architecture where the proportional and integral parts are separated from each other. Proportional gain and integral gain can be individually programmed by the user to define the bandwidth and noise transfer characteristics of the PLL2 in combination with the input modes.

Table 18. PLL2 Parameter and Register

PARAMETER	REGISTER	DESCRIPTION	MIN	TYP	MAX	UNIT
PLL2_PROP_SET	0x72	Proportional gain setting	0		63	
PLL2_CPROP	0x151	Proportional cap setting	3		5.4	pF
PLL2_INTG	0x80	Integral gain setting	0		31	
PLL2_RFILT	0x151	3 rd order filter resistor selection	4.7		9.2	kΩ
PLL2_CFILT	0x153	3 rd order filter capacitor selection	0	15	124	pF

The proportional gain can be changed using PLL2_PROP and PLL2_CPROP. The difference between the two modes is, PLL2_PROP controls the proportional charge pump current to define the gain and PLL2_CPROP controls the on-chip capacitor used in *active damping* to define the proportional gain. Higher values of PLL2_PROP result in higher proportional gain and Higher PLL2_CPROP values result in lower proportional gain.

9.3.5.2.4 PLL2 3rd Order Loop Filter

PLL2 also has programmable on-chip 3rd order loop filter in the proportional path to create additional pole for better noise cutting, as shown in [Figure 39](#). The resistor and capacitor value can be programmed as shown in [Table 19](#).

Table 19. 3rd Order Loop Filter

PARAMETER	DESCRIPTION
R3	PLL2_EN_FILTER=1 → Enables resistor PLL2_RFILT=0 → 9.2 kΩ PLL2_RFILT=1 → 4.7 kΩ
C3	PLL2_CFILT<5:0> 00000 → 0 pF 00001 → 4 pF .. 11111 → 124 pF

9.3.5.2.5 PLL2 Voltage Controlled Oscillator (VCO)

PLL contains on chip very low phase noise LC oscillator. The tuning range of the oscillator is 5800 MHz to 6200 MHz. The tuning range of the oscillator is 5800 MHz to 6175 MHz. The VCO is tuned to the target frequency using the semi-digital control by the PLL loop. Due to the semi-digital control, the PLL loops tracks the temperature and input frequency change with its loop bandwidth.

9.3.5.2.6 Examples of PLL2 Setting

This section shows PLL2 setting examples to generate given loop bandwidth.

9.3.5.3 Digital Lock Detect

Both PLL1 and PLL2 support digital lock detect. Digital lock detect compares the phase between the reference path (R) and the feedback path (N) of the PLL. When the time error (phase error) between the two signals is less than a specified window size (ϵ), a lock detect count increments. When the lock detect count reaches a user specified value, PLL1_LOCKDET_CYC_CNT or PLL2_LOCKDET_CYC_CNT, lock detect is asserted true. Once digital lock detect is true, a single phase comparison outside the specified window causes the digital lock detect to be asserted false; see [Figure 40](#).

Figure 40. Digital Lock Detect Flowchart

This incremental lock detect count feature functions as a digital filter to ensure that lock detect isn't asserted for only a brief time when the phases of R and N are within the specified tolerance for only a brief time during initial phase lock.

The digital lock detect signal can be monitored on the Status_LD1 or Status_LD2 pin. The pin may be programmed to output the status of lock detect for PLL1, PLL2, or both PLL1 and PLL2.

Figure 41. Digital Lock Detect Implementation

9.3.5.3.1 Calculating Digital Lock Detect Frequency Accuracy

See [Digital Lock Detect Frequency Accuracy](#) for more detailed information on programming the registers to achieve a specified frequency accuracy in ppm with lock detect.

The digital lock detect feature can also be used with holdover to automatically exit holdover mode. See [Exiting Holdover](#) for more info.

9.3.6 Holdover

Holdover mode causes PLL2 to stay locked on frequency with minimal frequency drift when an input clock reference to PLL1 becomes invalid. While in holdover mode, the PLL1 charge pump is TRI-STATED and a fixed tuning voltage is set on CPout1 to operate PLL1 in open-loop.

9.3.6.1 Holdover Flowchart

Figure 42. Holdover Flowchart Using LOS

9.3.6.2 Enable Holdover

Program `HOLDOVER_EN` = 1 to enable holdover mode for PLL1.

9.3.6.2.1 Automatic Tracked CTRL_VCXO Holdover Mode

In holdover mode, PLL1 retains the last used control voltage.

9.3.6.3 Enter Holdover

Holdover can be entered through different events.

- `LOS_x` detects reference loss.
- PLL1 DLD detects PLL1 unlock.
- `CTRL_VCXO` rail detect.
- Manual through register control
- Manual through pin
- Start-up into holdover

9.3.6.3.1 LOS_x Detect

Enter holdover if reference is lost.

9.3.6.3.2 PLL1 DLD Detect

Enter holdover if PLL1 is unlocked.

9.3.6.3.3 CTRL_VCXO Rail Detect

Rail detection allows to set upper and lower boundaries for the tuning voltage.

Once the boundaries are touched, the device enters holdover mode if this feature is enabled. The boundaries get compared against the current 40-bit value of the PLL1 storage cells array. It can be determined whether the boundaries are absolute or relative boundaries.

NOTE

The storage cells array is encoded with a thermometer code and the register values are binary encoded. A conversion must take place before comparing.

Enter holdover if `CTRL_VCXO` crosses a programmable high or low limit of `CTRL_VCXO`.

- If `CTRL_VCXO` $\leq$ `RAILDET_LOW`, then go to holdover or into normal operation.
- If `CTRL_VCXO` $\geq$ `RAILDET_UPP`, then go to holdover or into normal operation.

`CTRL_VCXO_HIGH/LOW_RAIL` granularity is 82.5 mV.

9.3.6.3.3.1 Absolute Limits

`RAILDET_LOW` and `RAILDET_UPP` values are considered as absolute numbers, being compared against current storage value.

9.3.6.3.3.2 Relative Limits

`RAILDET_LOW` and `RAILDET_UPP` values are considered as relative numbers. After PLL1 has locked the current storage value is added to the relative numbers to form the absolute boundary.

9.3.6.3.4 Manual Holdover Enable – Register Control

When `PLL1_HOLDOVER_FORCE` is 1 PLL1 enters holdover mode regardless of other conditions.

9.3.6.3.5 Manual Holdover Enable – Pin Control

The SYNC control pin can be programmed to control the entry and exit of holdover.

9.3.6.3.6 Start-Up into Holdover

During the initial programming, the LMK0461x can be configured to start-up into holdover. It presets the VCXO Control voltage to approximately 1.2 V. This allows PLL2 to lock to the VCXO reference. PLL1 locks as soon a valid reference input clock is detected. The holdover status can be optionally displayed at the status pins.

9.3.6.4 During Holdover

PLL1 is run in open-loop mode:

- PLL1 charge pump is set to TRI-STATE.
- PLL1 DLD is unasserted.
- The HOLDOVER status is asserted.
- During holdover, if the PLL2 was locked prior to entry of holdover mode, PLL2 DLD continues to be asserted.
- LOS engine searches for active input clock.
- PLL1 attempts to lock with the active clock input.

The HOLDOVER status signal can be monitored on the Status_LD1 or Status_LD2 pin by programming the PLL1_DLD_MUX or PLL2_DLD_MUX register to *Holdover Status*.

9.3.6.5 Exiting Holdover

Holdover mode can be exited in one of four ways.

- Manually by programming the device from the host.
- Manual through pin.
- Automatically by a clock operating within a specified ppm of the current PLL1 frequency on the active clock input.
- Automatically by LOS deassertion.
- Automatically by switching to next clock input after holdover counter overflow. The order of switching is set in a priority list.

9.3.6.6 Holdover Frequency Accuracy

The holdover frequency accuracy depends on the PLL1 loop bandwidth. A low loop bandwidth of ≤ 10 Hz results in less than 0.6-ppm accuracy typical.

9.3.6.7 Holdover Mode – Automatic Exit by LOS Deassertion

As soon as the reference clock is valid again and the LOS signal is deasserted, the PLL1_N and PLL1_R divider reset and PLL1 exits holdover.

9.3.6.8 Holdover Mode – Automatic Exit of Holdover With Holdover Counter

A programmable holdover counter can be set between 0 and 17 seconds count time. The counter starts counting as soon the device is in holdover.

If the reference clock is valid again within the specified time, the device exits holdover.

If the counter overflows, the device switches to the next clock input. The order of clock inputs is set in a priority list.

- Minimum Holdover counter configuration step size: 4.069 ns
- Holdover counter range: 0 – 17 s

9.3.7 JEDEC JESD204B

Table 21 illustrates the some possible SYNC and SYSREF modes.

Table 21. Possible SYNC/SYSREF_REQ Configurations

NAME	DESCRIPTION
SYNC Disabled	No SYNC occurs.
Pin or SPI SYNC	Basic SYNC functionality, SYNC pin polarity is selected by SYNC_POL. To achieve SYNC through SPI, toggle the SYNC_POL bit.
JESD204B Pulser on pin transition.	Produce SYSREF_PULSE_CNT programmed number of pulses on pin transition. SYNC_POL can be used to cause SYNC through SPI.
JESD204B Pulser on SPI programming.	Programming SYSREF_PULSE_CNT register starts sending the number of pulses.
External SYSREF request	When SYNC pin is asserted, continuous SYSREF pulses occur. Turning on and off of the pulses is SYNChronized to prevent runt pulses from occurring on SYSREF.
Continuous SYSREF	Continuous SYSREF signal.

LMK0461x family provides support for JEDEC JESD204B. High-frequency device clock and low frequency SYSREF clocks can be generated with programmable analog and digital delays and SYNC functionality. The device provides possibility to control the SYNC and SYSREF functions by SYNC pin (pin mode) or SPI programming. Each clock output can be used either as a device clock or SYSREF clock. Steps to use the SYNC and SYSREF modes are described in Figure 43.

Figure 43. Manual SYSREF Setup

The programming of the SYNC and SYSREF modes can be already done at the device setup. One time SYNC for the output channels is issued automatically at the device start-up irrespective of the SYNC programming. Detail description on setting up the SYNC and SYSREF modes are described in the following sections.

9.3.7.1 SYNC Pins

The SYNC pin in LMK0461x family has multiple functions which can be configured by the user using SPI interface. Following table lists the possible function:

Table 22. SYNC Pins

BIT NAME	FUNCTION	
EN_SYNC_PIN_FUNC	Enables the different functions at the SYNC pin when 1	
SYNC_INV	Inverts SYNC Input when 1	
SYNC_PIN_FUNC[1:0]	00	SYNC output channels
	01	SYSREF Request
	10	Reset PLL1 N-divider and R-divider
	11	Reserved
SYNC_ANALOGDLY_EN	Enables the Analog delay at the SYNC input pin	
SYNC_ANALOGDLY[4:0]	Analog delay can be programed from 0-15. See Analog Delay for details	

9.3.7.2 SYNC modes

SYNC can be requested by either PIN or using the SPI interface. Following table lists the register values that must be programmed to use the SYNC functionality:

Table 23. Additional SYNC Bits

BIT NAME	FUNCTION
GLOBAL_SYNC	Global SW SYNC. Writing 1 puts the Device into SYNC mode. Writing 0 exits SYNC mode.
SYNC_EN_CH1 SYNC_EN_CH2 SYNC_EN_CH3_4 SYNC_EN_CH5 SYNC_EN_CH6 SYNC_EN_CH7_8 SYNC_EN_CH9 SYNC_EN_CH10	Enables the corresponding channel for SYNC functionality

Steps to configure each mode are described below.

- SYNC pin mode:
 1. EN_SYNC_PIN_FUNC should be set to 1. This enables the different functions supported by the SYNC pin.
 2. SYNC_PIN_FUNC[1:0] should be programmed to 00b (default). This sets the SYNC pin for SYNC function.
 3. SYNC_INV, when 0, SYNC is rising edge triggered. When set to 1, the SYNC pin is internally inverted and is falling edge triggered.
 4. SYNC_EN_CHx should be set 1 for the channels which needs to SYNCed.
 5. Depending on the SYNC_INV value, the output channels are SYNChronized by either rising edge or the falling edge on the SYNC pin.
- SYNC SPI mode:
 1. EN_SYNC_PIN_FUNC should be set to 0. This disables the pin mode for SYNC function.
 2. SYNC_EN_CHx should be set 1 for the channels which must SYNCed.
 3. Writing 1 to the GLOBAL_SYNC puts the device into SYNC mode.

9.3.7.3 SYSREF Modes

Any channel can be programmed to generate SYSREF clock. There are different SYSREF modes supported by LMK0461x. SYSREF can be either fixed number of pulses or a continuous clock. There is a 5-bit register provided to program the number of pulses to be generated at each SYSREF request. Also, there is a possibility to control the number of pulses with the SYNC pin. Each SYSREF clock can be individually delayed. There are different options to introduce the delay in the SYSREF path. See [Digital Delay](#) and [Analog Delay](#) for programming the delays. Following bits needs to be programmed to use the SYSREF feature:

Table 24. SYSREF Registers

BIT NAME	FUNCTION
EN_SYNC_PIN_FUNC	Enable SYNC_SYSREF features at SYNC pin
GLOBAL_CONT_SYSREF	Enable continuous SYSREF
GLOBAL_SYSREF	Trigger SYSREF, Self-clearing
OUTCH_SYSREF_PLSCNT	Set number of desired SYSREF pulses from 1 to 32. 0 Enables continuous SYSREF
SYSREF_EN_CH10 SYSREF_EN_CH9 SYSREF_EN_CH7_8 SYSREF_EN_CH6 SYSREF_EN_CH5 SYSREF_EN_CH3_4 SYSREF_EN_CH2 SYSREF_EN_CH1	Enable SYSREF feature at channel CHx

9.3.7.3.1 SYSREF Pulser

This mode allows for the output of 1 to 32 SYSREF pulses for every SYNC pin event or SPI programming. This implements the gapped periodic functionality of the JEDEC JESD204B specification.

Figure 44. SYSREF Pulser

9.3.7.3.1.1 SPI Pulser Mode

OUTCH_SYSREF_PLSCNT is a 5-bit register that can be programmed to the required number of pulses.

When GLOBAL_SYSREF is programmed to 1, fixed number of pulses are defined by OUTCH_SYSREF_PLSCNT are generated at the output channels which are enabled for SYSREF. The GLOBAL_SYSREF bit is cleared automatically after fulfilling the SYSREF request.

9.3.7.3.1.2 Pin Pulser Mode

By programming EN_SYNC_PIN_FUNC= 1, SYNC_PIN_FUNC=01 and OUTCH_SYSREF_PLSCNT to the desired number of pulses, The SYSREF output is in pin control Pulser mode. The SYSREF clock can be initiated by a pulse at the SYNC pin. Fixed number of pulses as per the OUTCH_SYSREF_PLSCNT value are generated after a fixed latency.

9.3.7.3.1.3 Multiple SYSREF Frequencies

In case of multiple SYSREF frequencies the latencies until SYSREF pulses start are different. As shown in Figure 45, the different SYSREF signals are rising edge aligned with the device clock. The different SYSREF signals might not be rising edge aligned if different SYSREF frequencies are used.

Figure 45. SYSREF Timing in Pulsor Mode With Different SYSREF Frequencies

9.3.7.3.2 Continuous SYSREF

This mode allows for continuous output of the SYSREF clock.

Setting GLOBAL_CONT_SYSREF to 1 allows for continuous output of the SYSREF clock.

Continuous operation of SYSREF is not recommended due to crosstalk from the SYSREF clock to device clock. JESD204B is designed to operate with a single burst of pulses to initialize the system at start-up, after which it is theoretically not required to send another SYSREF because the system continues to operate with deterministic phases.

If continuous operation of SYSREF is required, consider using a SYSREF output from a non-adjacent output or SYSREF from the OSCout pin to minimize crosstalk.

Figure 46. Continuous SYSREF

9.3.7.3.3 SYSREF Request

This mode allows an external source to SYNChronously turn on or off a continuous stream of SYSREF pulses using the SYNC pin.

When programming EN_SYNC_PIN_FUNC= 1, SYNC_PIN_FUNC=01 and OUTCH_SYSREF_PLSCNT=0, the SYSREF output is in pin mode. The SYSREF pulses can be controlled by the pulse width at the SYNC pin. When the SYNC pin is asserted, the channel is SYNChronously set to continuous mode providing continuous pulses at the SYSREF frequency until the SYNC pin is unasserted. SYSREF stops after completing the final pulse SYNChronously.

Figure 47. SYSREF Request

9.3.7.4 How to Enable SYSREF

Enabling JESD204B operation involves SYNChronizing all the clock dividers and programming of the delays, then configuring the actual SYSREF functionality.

9.3.7.4.1 Setup Example 1: Pulser Mode, Pin Controlled

1. Program EN_SYNC_PIN_FUNC=1, SYNC pin is enabled for SYSREF requests.
2. Program SYNC_PIN_FUNC=01, SYNC pin is programmed to accept the SYSREF requests.
3. Program OUTCH_SYSREF_PLSCNT= xx (max 32), programs the number of SYSREF pulses to be generated.
4. Program SYSREF_EN_CHxx=1, enables corresponding output channels to generate SYSREF clock pulses.
5. Apply rising Edge at SYNC pin generates xx number of at the enabled at the enabled channel.

9.3.7.4.2 Setup Example 2: Pulser Mode, Spi Controlled

1. Program EN_SYNC_PIN_FUNC=0, the SYSREF function on the SYNC pin is not enabled.
2. Program OUTCH_SYSREF_PLSCNT= xx (max 32), programs the number of SYSREF pulses to be generated.
3. Program SYSREF_EN_CHxx=1, enables corresponding output channels to generate SYSREF clock pulses.
4. Programming GLOBAL_SYSREF=1 generates the defined number of pulses on the SYSREF enabled channels.

9.3.8 Low Skew Mode

The LMK0461x low skew mode is an internal feedback loop that minimizes the phase error between output and reference input. The feedback can be selected from CLKout5 or CLKout6.

Figure 48. Low Skew Mode

9.3.9 Power-Up Sequence

Figure 49 shows the steps to power up the device.

Figure 49. Simplified Power-Up Sequence

The first step is to apply all the supplies needed for device to be functional. The RESETn should be kept at logic 0 when power supplies start ramping. LMK046xx devices do not need any specific power up sequencing for the external power supplies. The on-chip POR logic makes sure that the device stays in power-down state until all the supplies are available.

After all the device power supplies are stable, RESETn can be released to logic 1. The device enters idle state and is now ready for the SPI programming.

After programming the device configuration, the DEV_start-up should be triggered using SPI, which initiates the device bootup sequence. The loading of the configurations to the corresponding functional blocks and enable sequencing is cared for by the on-chip state machines. One-time SYNC is also issued to the output channels during device booting. The lock signals for the PLLs can be observed at the STAT0/1.

Figure 50 shows the LMK0461x booting sequence of operations in details. Branch A, B, and C run in parallel.

Figure 50. Detailed Power-Up Sequence

9.4 Device Functional Modes

The following section describes the settings to enable various modes of operation for the LMK0461x device family.

The LMK0461x device is a flexible device that can be configured for many different use cases. The following simplified block diagrams help show the user the different use cases of the device.

9.4.1 Dual PLL

Figure 59 illustrates the typical use case of the LMK0461x device family in dual-loop mode. In dual-loop mode the reference to PLL1 from CLKIn0, CLKIn1, CLKIn2, or CLKIn3 (LMK04610 only has two inputs). An external VCXO or tunable crystal is used to provide feedback for the first PLL and a reference to the second PLL. This first PLL cleans the jitter with the VCXO or low-cost tunable crystal by using a narrow loop bandwidth. The VCXO or tunable crystal output may be buffered through the OSCout port. The VCXO is used as the reference to PLL2 and may be doubled using the frequency doubler. The internal VCO drives up to 8 divide or delay blocks which drive up to 10 clock outputs.

Holdover functionality is optionally available when the input reference clock is lost. Holdover works by fixing the tuning voltage of PLL1 to the VCXO.

It is also possible to use an external VCO in place of the internal VCO of PLL2. In this case, one less CLKIn is available as a reference.

9.5 Programming

LMK0461x device is programmed using 24-bit registers. Each register consists of a 1-bit command field (R/W), a 15-bit address field (A14 to A0) and a 8-bit data field (D7 to D0). The contents of each register is clocked in MSB first (R/W), and the LSB (D0) last. During programming, the CS* signal is held low. The serial data is clocked in on the rising edge of the SCK signal. After the LSB is clocked in, the CS* signal goes *high* to latch the contents into the shift register. TI recommends programming registers in numeric order -- for example, 0x000 to 0x1FFF -- to achieve proper device operation. Each register consists of one or more fields that control the device functionality. See the electrical characteristics and [Figure 1](#) for timing details.

R/W bit = 0 is for SPI write. R/W bit = 1 is for SPI read.

9.5.1 Recommended Programming Sequence

The default programming sequence from POR involves:

1. Toggle RESETn pin High-Low-High
2. Program all registers with Register 0x0011 bit 0 = 0
3. Program Register 0x0011 bit 0 = 1

Also refer to [Power-Up Sequence](#).

9.5.1.1 Readback

Readback of the complete register content is possible.

9.6.2 Device Register Descriptions

The following section details the fields of each register, the Power-On-Reset Defaults, and specific descriptions of each bit.

In some cases similar fields are located in multiple registers. In this case specific outputs may be designated as X or Y. In these cases, the X represents even numbers from 0 to 12 and the Y represents odd numbers from 1 to 13. In the case where X and Y are both used in a bit name, then $Y = X + 1$.

9.6.2.1 CONFIGA

The CONFIGA Register provides control of the SPI operation. The data written to this register must always be symmetrical otherwise the write will not take place, that is, Bit0=Bit7, Bit1=Bit6, Bit2=Bit5, Bit3=Bit4. Return to [Register Map](#).

Table 26. Register – 0x00

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	SWRST	RWSC	0	Software Reset. Writing a 1 to SWRST resets the device apart from the SPI programmable registers. SWRST is automatically cleared to 0.
[6]	LSB_FIRST	RW	0	Least Significant Bit First. This feature is not support, register data is always transmitted MSB first.
[5]	ADDR_ASCEND	RW	0	Address Increment Ascending. When set to 1 the address in streaming transactions is incremented by 1 after each data byte. When set to 0 the address is decremented by 1 in streaming transactions.
[4]	SDO_ACTIVE	RW	0	SDO Active. SDO is always active. This bit always reads 1.
[3]	SDO_ACTIVE_CPY	RW	0	SDO Active. Must be programmed equal to bit 4.
[2]	ADDR_ASCEND_CPY	RW	0	Address Increment Ascending. Must be programmed equal to bit 5.
[1]	LSB_FIRST_CPY	RW	0	Least Significant Bit First. Must be programmed equal to bit 6.
[0]	SWRST_CPY	RWSC	0	Software Reset. Must be programmed equal to bit 7.

[3]	CH6TO10EN	RW	1	Enable Channels 6 to 10 during the start-up sequence.
[2]	CH1TO5EN	RW	1	Enable Channels 1 to 5 during the start-up sequence.
[1]	PLL2EN	RW	1	Activate PLL2 during the start-up sequence.
[0]	PLL1EN	RW	1	Activate PLL1 during the start-up sequence.

9.6.2.18 STARTUP

The STARTUP Register allows device activation to be triggered. Return to [Register Map](#).

Table 43. Register – 0x11

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:1]	RSRVD	-	-	Reserved.
[0]	DEV_STARTUP	RW	0	Device Start-up. When DEV_STARTUP is 1 the device activation sequence is triggered. The device modules that are automatically enabled during the sequence is determined by the STARTUP_CFG register. If DEV_STARTUP is 1 on exit from software reset then the start-up sequence is also triggered.

9.6.2.19 DIGCLKCTRL

The DIGCLKCTRL Register allows control of the digital system clock. Return to [Register Map](#).

Table 44. Register – 0x12

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:3]	RSRVD	-	-	Reserved.
[2]	DIG_CLK_EN	RW	1	Digital Clock Enable. When DIG_CLK_EN is 1 the digital system clock is active. When DIG_CLK_EN is 0 the digital system clock is disabled.
[1]	PLL2_DIG_CLK_EN	RW	1	Enable PLL2 Digital Clock Buffer.

Table 44. Register – 0x12 (continued)

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[0]	PORCLKAFTERLOCK	RW	0	POR Clock behavior after Lock. If PORCLKAFTERLOCK is 0 then the system clock is switched from the POR Clock to the PLL2 Digital Clock after lock and the POR Clock oscillator is disabled. If PORCLKAFTERLOCK is 1, the POR Clock remains as the digital system clock regardless of the PLL Lock state.

9.6.2.20 PLL2REFCLKDIV

The PLL2REFCLKDIV Register controls the PLL2 Reference Clock Divider value. Return to [Register Map](#).

Table 45. Register – 0x13

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:5]	RSRVD	-	-	Reserved.
[4:0]	PLL2_REF_DIGCLK_DIV[4:0]	RW	0x0	PLL2 Ref Clock Divider for Digital Clock. Defines the divider ratio for the PLL2 Reference Clock that can be used as the digital system clock. PLL2_REF_DIGCLK_DIV– Divider Value b00000– 32 b00001– 16 b00010– 8 b00100– 4 b01000– 2 b10000– 1

9.6.2.21 GLOBL_SYNC_SYSREF

The GLOBL_SYNC_SYSREF Register provides software control of the SYSREF and SYNC features. Return to [Register Map](#).

Table 46. Register – 0x14

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	EN_SYNC_PIN_FUNC	RW	0	Enable SYNC_SYSREF features at SYNC pin.
[6]	RSRVD	-	-	Reserved.
[5]	GLOBAL_CONT_SYSREF	RW	0	Enable continuous SYSREF.
[4]	GLOBAL_SYSREF	RWSC	0	Trigger SYSREF. Self-clearing.
[3]	INV_SYNC_INPUT_SYNC_CLK	RW	0	Invert the internal synchronization clock for SYNC input sync (For PLL1 N- and R-Divider Reset)
[2:1]	SYNC_PIN_FUNC[1:0]	RW	0x0	SYNC input pin function. SYNC_PIN_FUNC– Function 00– SYNC output channels 01– Sysref Request 10– Reset PLL1 N- and R-Divider 11– Reserved
[0]	GLOBAL_SYNC	RW	0	Global SW SYNC. Writing 1 puts the Device into SYNC mode. Writing 0 exits SYNC mode.

9.6.2.22 CLKIN_CTRL0

The CLKIN_CTRL0 Register provides control of CLK Input features. Return to [Register Map](#).

Table 47. Register – 0x15

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:4]	RSRVD	-	-	Reserved.
[3]	CLKIN_STAGGER_EN	RW	1	CLKINBLK Staggered Activation/Deactivation. When CLKIN_STAGGER_EN is 1, the input clock stages are activated and deactivated one at a time.

Table 47. Register – 0x15 (continued)

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[2]	CLKIN_SWRST	RWSC	0	CLKINBLK Software Reset. Writing a 1 to CLKIN_SWRST resets the CLKIN Block. The CLKIN_SWRST is cleared automatically to 0.
[1]	RSRVD	-	-	Reserved.
[0]	CLKINSEL1_INV	RW	0	CLKIN_SEL Invert. CLKINSEL1_INV– Polarity 0– Non-Inverted 1– Inverted

9.6.2.23 CLKIN_CTRL1

The CLKIN_CTRL1 Register provides control of CLK Input features. Return to [Register Map](#).

Table 48. Register – 0x16

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	CLKINBLK_ALL_EN	RW	0	CLK Inputs All Enabled after Clock Switch. If CLKINBLK_ALL_EN is 1 then all clock input paths remain enabled after a valid clock has been selected. If CLKINBLK_ALL_EN is 0 then the clock paths are disabled apart from the selected clock.
[6:5]	CLKINSEL1_MODE[1:0]	RW	0x0	CLK Input Select Mode. CLKINSEL1_MODE– CLOCK Selection Mode 0– Auto 1– Pin 2– Register
[4]	CLKINBLK_EN_BUF_CLK_P_LL	RW	0	Clock Buffer for PLL1 Enable.
[3]	CLKINBLK_EN_BUF_BYP_P_LL	RW	0	Clock Buffer for PLL2 Enable (PLL1 By-Passed).
[2]	RSRVD	RW	0	Reserved.
[1]	RSRVD	RW	0	Reserved.
[0]	RSRVD	RW	0	Reserved.

9.6.2.24 CLKIN0CTRL

The CLKIN0CTRL Register provides control of the CLK0 input path. Return to [Register Map](#).

Table 49. Register – 0x19

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	RSRVD	-	-	Reserved.
[6]	CLKIN0_PLL1_INV	RW	1	Inverts CLKIN0_PLL1_RDIV. 0=Noninverted 1=Inverted
[5]	CLKIN0_LOS_FRQ_DBL_EN	RW	0	CLKIN0 Loss of Source Frequency Doubler Enable.
[4]	CLKIN0_EN	RW	0	CLKIN0 Input Stage Enable. (not clk buffer).
[3]	CLKIN0_SE_MODE	RW	1	CLKIN0 Signal Mode. CLKIN0_SE_MODE– Signal Mode Selection 0– Differential 1– Single-ended
[2:0]	CLKIN0_PRIO[2:0]	RW	0x3	CLKIN0 Priority. CLKIN0_PRIO– Clock Priority 0– Clock Disabled 1– Priority 1– Highest 2– Priority 2 3– Priority 3 4– Priority 4– Lowest

9.6.2.25 CLKIN1CTRL

The CLKIN1CTRL Register provides control of the CLK1 input path. Return to [Register Map](#).

Table 50. Register – 0x1A

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	RSRVD	-	-	Reserved.
[6]	CLKIN1_PLL1_INV	RW	1	Inverts CLKIN1_PLL1_RDIV. 0=Non-Inverted 1=Inverted
[5]	CLKIN1_LOS_FRQ_DBL_EN	RW	0	CLKIN1 Loss of Source Frequency Doubler Enable.
[4]	CLKIN1_EN	RW	0	CLKIN1 Input Stage Enable. (not CLK buffer).
[3]	CLKIN1_SE_MODE	RW	1	CLKIN1 Signal Mode. CLKIN1_SE_MODE– Signal Mode Selection 0– Differential 1– Single-ended
[2:0]	CLKIN1_PRIO[2:0]	RW	0x4	CLKIN1 Priority. CLKIN1_PRIO– Clock Priority 0– Clock Disabled 1– Priority 1– Highest 2– Priority 2 3– Priority 3 4– Priority 4– Lowest

9.6.2.26 CLKIN0RDIV_BY1

The CLKIN0 RDIV Values is determined by CLKIN0RDIV_BY1 and CLKIN0RDIV_BY0. Return to [Register Map](#).

Table 51. Register – 0x1F

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION

9.6.2.29 CLKIN1RDIV_BY0

The CLKIN1RDIV_BY0 Register controls the lower 8-bits of the CLKIN1 Reference Divider. Return to [Register Map](#).

Table 54. Register – 0x22

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	CLKIN1_PLL1_RDIV[7:0]	RW	0x78	CLKIN1 PLL1 Reference Divider Value.

9.6.2.30 CLKIN0LOS_REC_CNT

The CLKIN0LOS_REC_CNT Register sets the CLKIN0 Loss of Source recovery counter value. Return to [Register Map](#).

Table 55. Register – 0x27

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	CLKIN0_LOS_REC_CNT[7:0]	RW	0x14	CLKIN0 LOS Recovery Counter Value. CLKIN0_LOS_REC_CNT– Counter Value 0– 15+0*16 1– 15+1*16 2– 15+2*16 3– 15+3*16 ..– .. 255– 15+255*16

9.6.2.31 CLKIN0LOS_LAT_SEL

The CLKIN0LOS_LAT_SEL Register sets the CLKIN0 Loss of Source latency. Return to [Register Map](#).

Table 56. Register – 0x28

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	CLKIN0_LOS_LAT_SEL[7:0]	RW	0x80	CLKIN0 LOS Max Latency for LOS Detection.

9.6.2.32 CLKIN1LOS_REC_CNT

The CLKIN1LOS_REC_CNT Register sets the CLKIN1 Loss of Source recovery counter value. Return to [Register Map](#).

Table 57. Register – 0x29

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	CLKIN1_LOS_REC_CNT[7:0]	RW	0x14	CLKIN1 LOS Recovery Counter Value. CLKIN1_LOS_REC_CNT– Counter Value 0– 15+0*16 1– 15+1*16 2– 15+2*16 3– 15+3*16 ..– .. 255– 15+255*16

9.6.2.33 CLKIN1LOS_LAT_SEL

The CLKIN1LOS_LAT_SEL Register sets the CLKIN1 Loss of Source latency. Return to [Register Map](#).

Table 58. Register – 0x2A

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	CLKIN1_LOS_LAT_SEL[7:0]	RW	0x80	CLKIN1 LOS Max Latency for LOS Detection.

9.6.2.34 CLKIN_SWCTRL0

The CLKIN_SWCTRL0 Register provides control of the input settling time after switching to another Ref channel for Loss-Of-Signal Inspection. Return to [Register Map](#).

Table 59. Register – 0x2B

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:5]	RSRVD	-	-	Reserved.
[4:0]	SW_CLKLOS_TMR[4:0]	RW	0x0	Wait Time for a Valid LOS Detection. Used during Priority Switching in Auto CLKin selection mode.

9.6.2.35 CLKIN_SWCTRL1

The CLKIN_SWCTRL1 Register provides control of the Loss-Of-Signal Channel select. Return to [Register Map](#).

Table 60. Register – 0x2C

9.6.2.36 CLKIN_SWCTRL2

The CLKIN_SWCTRL2 Register provides control of the input stage settling time when switching on all inputs in case of Loss-Of-Signal. Return to [Register Map](#).

Table 61. Register – 0x2D

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:5]	RSRVD	-	-	Reserved.
[4:0]	SW_ALLREFSON_TMR[4:0]	RW	0x0	Wait Time to allow Clock Inputs to Settle.

9.6.2.37 OSCIN_CTRL

The OSCIN_CTRL Register provides control of the OSCIN signal path. Return to [Register Map](#).

Table 62. Register – 0x2E

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:6]	RSRVD	-	-	Reserved.
[5]	OSCIN_PD_LDO	RW	0	OSCIN LDO Power Down. OSCIN_PD_LDO– LDO State 0– LDO On 1– LDO Off
[4]	OSCIN_SE_MODE	RW	1	OSCin Signal Mode. OSCIN_SE_MODE– Signal Mode Selection 0– Differential 1– Single-ended
[3]	OSCIN_BUF_TO_OSCOUT_EN	RW	1	OSCin to OSCout Buffer Enable.
[2]	OSCIN_OSCINSTAGE_EN	RW	1	OSCin Clock Input Stage Enable.

Table 62. Register – 0x2E (continued)

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[1]	OSCIN_BUF_REF_EN	RW	0	OSCin to PLL1 and PLL2 Ref Clock Buffer Enable.
[0]	OSCIN_BUF_LOS_EN	RW	0	OSCin to LOS Clock Buffer Enable.

9.6.2.38 OSCOUT_CTRL

The OSCOUT_CTRL Register controls the OSCOUT Function. Return to [Register Map](#).

Table 63. Register – 0x2F

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	OSCOUT_LVCMOS_WEAK_DRIVE	RW	0	Enable OSCOUT LVCMOS weak drive.
[6]	OSCOUT_DIV_REGCONTR_OL	RW	0	Enable OSCOUT Divider setting through configuration register rather than SYNC pin control.
[5:4]	OSCOUT_PINSEL_DIV[1:0]	R	0x0	OSCOUT pin-selected Divider. OSCOUT_PINSEL_DIV– Pin-Selected Oscout Divider ratio 00– 1 01– 2 10– 2 11– 4
[3]	OSCOUT_SEL_VBG	RW	0	OSCOUT Bandgap Source Select. When OSCOUT_SEL_VBG is 0 the PLL1 Bandgap is used for OSCOUT. If OSCOUT_SEL_VBG is 1 the Output Channel Bandgap is used.
[2]	OSCOUT_DIV_CLKEN	RW	1	OSCout Divider Clock Enable. (RESERVED for PG1p0)
[1]	OSCOUT_SWRST	RWSC	0	OSCOUT Software Reset. Writing a 1 to OSCOUT_SWRST resets the OSCOUT Block. The OSCOUT_SWRST is cleared automatically to 0.
[0]	OSCOUT_SEL_SRC	RW	1	OSCout Clock source select. OSCOUT_SEL_SRC– Clock Source 0– PLL2 Output 1– OSCin

9.6.2.39 OSCOUT_DIV

The OSCOUT_DIV Register controls the OSCOUT Divider. Return to [Register Map](#).

Table 64. Register – 0x30

[0]	OUTCH1_DIV_INV	RW	0	OUTCH1 Divider Output Invert. When OUTCH1_DIV_INV is 1 the divider output for channel 1 is inverted.

9.6.2.75 PLL1CTRL0

The PLL1CTRL0 Register provides control of the following PLL1 related features. Return to [Register Map](#).

Table 100. Register – 0x54

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	PLL1_F_30	RW	0	PLL1 RC Freq 0=122MHz 1=32MHz. PLL1_F_30– PLL1 RC Frequency 0– 122MHz 1– 32MHz
[6]	PLL1_EN_REGULATION	RW	0	PLL1 Prop-CP Enable Regulation
[5]	PLL1_PD_LD	RW	1	PLL1 Window Comparator Power Down. PLL1_PD_LD– PLL1 Window Comparator 0– Enabled 1– Off
[4]	PLL1_DIR_POS_GAIN	RW	1	PLL1 VCXO pos/neg Gain. PLL1_DIR_POS_GAIN– Polarity 0– Positive 1– Negative
[3:0]	PLL1_LDO_WAIT_TMR[3:0]	RW	0x0	PLL1 LDO Wait Timer. The PLL1 LDO Wait Timer counts a number of clock cycles equal to 32*(PLL1_LDO_WAIT_TMR+31) before releasing the PLL1 NDIV and RDIV resets.

9.6.2.76 PLL1CTRL1

The PLL1CTRL1 Register provides control over PLL1 related features. Return to [Register Map](#).

Table 101. Register – 0x55

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	PLL1_LCKDET_BY_32	RW	0	PLL1 Lock Detect counter multiply with 32.
[6]	PLL1_FAST_LOCK	RW	1	PLL1 Fast Lock Enable.
[5]	PLL1_LCKDET_LOS_MASK	RW	0	PLL1 Lock Detect LOS Mask. When PLL1_LCKDET_LOS_MASK is 1 then Loss of Source has no effect on the PLL1 Lock Detect circuit.
[4]	PLL1_FBCLK_INV	RW	1	PLL1 Feedback Clock Inversion. When PLL1_FBCLK_INV is 1 then the Feedback Clock divider output is inverted.
[3]	RSRVD	-	-	Reserved.
[2]	PLL1_BYP_LOS	RW	0	PLL1 Bypass Loss of Source indication. When PLL1_BYP_LOS is 1 the PLL1 controller ignores the LOS indicator.
[1]	PLL1_PFD_UP_HOLD OVER	RW	0	PLL1 PFD UP-Input value during Holdover.
[0]	PLL1_PFD_DOWN_HOLD OVER	RW	0	PLL1 PFD DN-Input value during Holdover.

9.6.2.77 PLL1CTRL2

The PLL1CTRL2 Register provides control over PLL1 related features. Return to [Register Map](#).

Table 102. Register – 0x56

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:5]	RSRVD	-	-	Reserved.
[4]	PLL1_LOL_NORESET	RW	0	If set to 1, PLL1 will not reset on a Loss-of-Lock event.
[3]	PLL1_RDIV_CLKEN	RW	1	PLL1 RDIV Clock Enable.
[2]	PLL1_RDIV_4CY	RW	1	PLL1 RDIV Enable tied clock low phase to 4cycs. Independent from divider setting.
[1]	PLL1_NDIV_CLKEN	RW	1	PLL1 NDIV Clock Enable
[0]	PLL1_NDIV_4CY	RW	1	PLL1 NDIV Enable tied clock low phase to 4cycs. Independent from divider setting.

9.6.2.78 PLL1_SWRST

The PLL1_SWRST Register provides control of the PLL1 software resets. Return to [Register Map](#).

Table 103. Register – 0x57

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:6]	RSRVD	-	-	Reserved.
[5]	PLL1_HOLD OVER_DLD_SW RST	RWSC	0	PLL1 Holdover DLD Software Reset. Writing a 1 to PLL1_HOLD OVER_DLD_SWRST activates the reset. PLL1_HOLD OVER_DLD_SWRST is cleared automatically to 0.
[4]	PLL1_RDIV_SWRST	RWSC	0	PLL1 R-Divider Software Reset. Writing a 1 to PLL1_RDIV_SWRST resets the R-Divider. PLL1_RDIV_SWRST is cleared automatically to 0.
[3]	PLL1_NDIV_SWRST	RWSC	0	PLL1 N-Divider Software Reset. Writing a 1 to PLL1_NDIV_SWRST resets the N-Divider. PLL1_NDIV_SWRST is cleared automatically to 0.
[2]	PLL1_HOLD OVERCNT_SW RST	RWSC	0	PLL1 Holdover Counter Software Reset. Writing a 1 to PLL1_HOLD OVERCNT_SWRST activates the reset. PLL1_HOLD OVERCNT_SWRST is cleared automatically to 0.
[1]	PLL1_HOLD OVER_LOCKDE T_SWRST	RWSC	0	PLL1 Holdover Lock Detect Software Reset. Writing a 1 to PLL1_HOLD OVER_LOCKDET_SWRST activates the reset. PLL1_HOLD OVER_LOCKDET_SWRST is cleared automatically to 0.
[0]	PLL1_SWRST	RWSC	0	PLL1 Software Reset. Writing a 1 to PLL1_SWRST resets PLL1 PLL1_SWRST is cleared automatically to 0.

9.6.2.79 PLL1WNDWSIZE

The PLL1WNDWSIZE Register sets the PLL1 Window Comparator Size. Return to [Register Map](#).

Table 104. Register – 0x58

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL1_LD_WNDW_SIZE[7:0]	RW	0x3F	PLL1 Window Comparator Size.

9.6.2.80 PLL1STRCELL

The PLL1STRCELL Register provides control of the Storage Cell settings. Return to [Register Map](#).

Table 105. Register – 0x59

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:4]	PLL1_INTG_FL[3:0]	RW	0x1	PLL1 Integral Gain setting during Fast Lock.

The PLL1CPSETTING_FL Register provides control of the Chargepump Current/Bandwidth Setting during Fast Lock. Return to [Register Map](#).

Table 107. Register – 0x5B

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL1_PROP_FL[7:0]	RW	0xFF	Prop-CP Current/Bandwidth Setting for Fast Lock.

9.6.2.83 PLL1_HOLDOVER_CTRL1

The PLL1_HOLDOVER_CTRL1 Register provides control of the PLL1 holdover operation. Return to [Register Map](#).

Table 108. Register – 0x5C

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	PLL1_HOLDOVER_EN	RW	1	Enable PLL1 Holdover function. When PLL1_HOLDOVER_EN is 1 the holdover circuit is enabled. When PLL1_HOLDOVER_EN is 0 the holdover circuit is disabled.
[6]	PLL1_STARTUP_HOLDOVER_EN	RW	1	PLL1 Start-up in Holdover. When PLL1_HOLDOVER_FORCE is 1 PLL1 enters holdover mode immediately on start-up.
[5]	PLL1_HOLDOVER_FORCE	RW	0	PLL1 Force Holdover Operation. When PLL1_HOLDOVER_FORCE is 1 PLL1 enters holdover mode regardless of other conditions.
[4]	PLL1_HOLDOVER_RAIL_MODE	RW	0	PLL1 Rail Detection Level Relative or absolute. PLL1_HOLDOVER_RAIL_MODE– Level Mode 0– Absolute-Level 1– Relative to Level set at Lock
[3]	PLL1_HOLDOVER_MAX_CNT_EN	RW	1	PLL1 Holdover Max Counter enable. Wait for PLL1_HOLDOVER_MAXCNT cycles before starting Auto-CLKin-Switch procedure.
[2]	PLL1_HOLDOVER_LOS_MASK	RW	0	PLL1 Holdover LOS Mask. When PLL1_HOLDOVER_LOS_MASK is 1 then Loss of Source has no effect in the activation of holdover.
[1]	PLL1_HOLDOVER_LCKDET_MASK	RW	1	PLL1 Holdover Lock Detect Mask. When PLL1_HOLDOVER_LCKDET_MASK is 1 then Lock Detect has no effect in the activation of holdover.
[0]	PLL1_HOLDOVER_RAILDET_EN	RW	0	PLL1 Holdover Rail Detection Enable. When PLL1_HOLDOVER_RAILDET_EN is 1 the rail detection circuit is enabled. When PLL1_HOLDOVER_RAILDET_EN is 0 the rail detection circuit is disabled.

9.6.2.84 PLL1_HOLD OVER_MAXCNT_BY3

The PLL1_HOLD OVER_MAXCNT field is set by PLL1_HOLD OVER_MAXCNT_BY3,BY2,BY1 and BY0. Return to [Register Map](#).

Table 109. Register – 0x5D

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL1_HOLD OVER_MAX_CN T[31:24]	RW	0x0	PLL1 Maximum Holdover Count. When the value specified by PLL1_HOLD OVER_MAX_CN is reached then the device attempts to switch to any available reference clocks.

9.6.2.85 PLL1_HOLD OVER_MAXCNT_BY2

The PLL1_HOLD OVER_MAXCNT1 Register sets bits [23:16]. Return to [Register Map](#).

[4]	PLL1_RC_CLK_EN	RW	1	PLL1 RC Clock Enable.
[3]	RSRVD	-	-	Reserved.
[2:0]	PLL1_RC_CLK_DIV[2:0]	RW	0x7	PLL1 RC Clk Divider value. Sets the divider value for the PLL1 RC clock that is derived from the PLL2 VCO Clock. PLL1_RC_CLK_DIV– Divider Value 0– 1 1– 2 ..– .. 7– 8

9.6.2.99 PLL2_CTRL0

The PLL2_CTRL0 Register provides control of PLL2 features. Return to [Register Map](#).

Table 124. Register – 0x6C

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:5]	RSRVD	-	-	Reserved.
[4]	PLL2_VCO_PRESC_LOW_POWER	RW	0	PLL2 Prescaler Low Power Mode.
[3]	PLL2_BYP_OSC	RW	0	Clock Source for Oscout Buffer. PLL2_BYP_OSC– Oscout Clock Source 0– PLL2 Output 1– PLL2 Input
[2]	PLL2_BYP_TOP	RW	0	Clock Source for Top Outputs. PLL2_BYP_TOP– Top Outputs Clock Source 0– PLL2 Output 1– PLL2 Input
[1]	PLL2_BYP_BOT	RW	0	Clock Source for Bottom Outputs. PLL2_BYP_BOT– Bottom Outputs Clock Source 0– PLL2 Output 1– PLL2 Input

Table 124. Register – 0x6C (continued)

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[0]	PLL2_GLOBAL_BYP	RW	0	PLL2 Global Bypass Enable. PLL2_GLOBAL_BYP– PLL2 Input Clock Source 0– OSCin 1– CLKIN0..1

9.6.2.100 PLL2_CTRL1

The PLL2_CTRL1 Register provides control of PLL2 features. Return to [Register Map](#).

Table 125. Register – 0x6D

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	PLL2_EN_PULSE_GEN	RW	0	Enable Pulse Generator in PLL2 R input block.
[6]	PLL2_RDIV_BYP	RW	0	PLL2 R-Divider Bypass. When PLL2_RDIV_BYP is 1 the R-Divider is by-passed.
[5]	PLL2_DBL_EN_INV	RW	0	PLL2 Doubler Enable Invert. When PLL2_DBL_EN_INV is 1 the output of the PLL2 Doubler is inverted.
[4]	PLL2_PD_VARBIAS	RW	0	VCO Varactor Biasing PD.
[3]	PLL2_SMART_TRIM	RW	1	PLL2 Smart trim enable. If PLL2_SMART_TRIM is set to 1 then the initial calibration threshold is set by PLL2_AC_STRT_THRESHOLD and the final threshold is set by PLL2_AC_THRESHOLD. If PLL2_SMART_TRIM is 0 the threshold is set by PLL2_AC_THRESHOLD at all times.
[2]	PLL2_LCKDET_LOS_MASK	RW	1	PLL2 Lock Detect LOS Mask. When PLL2_LCKDET_LOS_MASK is 1 then Loss of Source has no effect on the PLL2 Lock Detect circuit.
[1]	PLL2_RDIV_DBL_EN	RW	0	PLL2 R-Divider Doubler Enable.
[0]	PLL2_PD_LD	RW	1	PLL2 Window Comparator Powerdown.

9.6.2.101 PLL2_CTRL2

The PLL2_CTRL2 Register provides control of PLL2 features. Return to [Register Map](#).

Table 126. Register – 0x6E

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	PLL2_BYP_SYNC_TOP	RW	0	RESERVED
[6]	PLL2_BYP_SYNC_BOTTOM	RW	0	RESERVED
[5]	PLL2_EN_BYP_BUF	RW	0	PLL2 Enable Bypass Clock Buffer.
[4]	PLL2_EN_BUF_SYNC_TOP	RW	1	PLL2 Enable Clock Buffer for Re-clocked SYNC signal to TOP Output-CHs.
[3]	PLL2_EN_BUF_SYNC_BOTTOM	RW	1	PLL2 Enable Clock Buffer for Re-clocked SYNC signal to Bottom Output-CHs.
[2]	PLL2_EN_BUF_OSCOUT	RW	0	PLL2 Enable Clock Buffer for OSCOut.
[1]	PLL2_EN_BUF_CLK_TOP	RW	1	PLL2 Enable Clock Buffer for Top Output-CHs.
[0]	PLL2_EN_BUF_CLK_BOTTOM	RW	1	PLL2 Enable Clock Buffer for Bottom Output-CHs.

9.6.2.102 PLL2_SWRST

The PLL2_SWRST Register allows activation of the following PLL2 related software resets. Return to [Register Map](#).

Table 127. Register – 0x6F

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:3]	RSRVD	-	-	Reserved.

Table 127. Register – 0x6F (continued)

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[2]	PLL2_RDIV_SWRST	RWSC	0	PLL2 R-Divider Software Reset. Writing a 1 to PLL2_RDIV_SWRST resets the R-Divider. PLL2_RDIV_SWRST is cleared automatically to 0.
[1]	PLL2_NDIV_SWRST	RWSC	0	PLL2 N-Divider Software Reset. Writing a 1 to PLL2_NDIV_SWRST resets the N-Divider. PLL2_NDIV_SWRST is cleared automatically to 0.
[0]	PLL2_SWRST	RWSC	0	PLL2 Software Reset. Writing a 1 to PLL2_SWRST resets PLL2. PLL2_SWRST is cleared automatically to 0.

9.6.2.103 PLL2_LF_C4R4

The PLL2_LF_C4R4 Register sets the values for C4 and R4. Return to [Register Map](#).

Table 128. Register – 0x70

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:4]	PLL2_C4_LF_SEL[3:0]	RW	0x0	PLL2 Loop Filter C4 Value.
[3:0]	PLL2_R4_LF_SEL[3:0]	RW	0x0	PLL2 Loop Filter R4 Value.

9.6.2.104 PLL2_LF_C3R3

The PLL2_LF_C3R3 Register sets the values for C3 and R3. Return to [Register Map](#).

Table 129. Register – 0x71

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:4]	PLL2_C3_LF_SEL[3:0]	RW	0x0	PLL2 Loop Filter C3 Value.
[3:0]	PLL2_R3_LF_SEL[3:0]	RW	0x0	PLL2 Loop Filter R3 Value.

9.6.2.105 PLL2_CP_SETTING

The PLL2_CP_SETTING Register provides control of the PLL2 Chargepump. Return to [Register Map](#).

Table 130. Register – 0x72

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_PROP[7:0]	RW	0x3	PLL2 Chargepump Setting. Setting limited to bits [5..0].

9.6.2.106 PLL2_NDIV_BY1

The PLL2 N-Divider Value is set by Register's PLL2_NDIV_BY1 and PLL2_NDIV_BY0. Return to [Register Map](#).

Table 131. Register – 0x73

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_NDIV[15:8]	RW	0x0	PLL2 N-Divider Value.

9.6.2.107 PLL2_NDIV_BY0

The PLL2_NDIV_BY0 Register sets bits [7:0]. Return to [Register Map](#).

Table 132. Register – 0x74

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_NDIV[7:0]	RW	0x20	PLL2 N-Divider Value.

RESERVED. Return to [Register Map](#).

Table 133. Register – 0x75

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_RDIV[15:8]	RW	0x0	PLL2 R-Divider Value. PLL2 R-Divider configuration limited to bits [5..0].

9.6.2.109 PLL2_RDIV_BY0

The PLL2_RDIV Register sets the PLL2 R-Divider bits [5:0]. Return to [Register Map](#).

Table 134. Register – 0x76

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_RDIV[7:0]	RW	0x0	PLL2 R-Divider Value. PLL2 R-Divider configuration limited to bits [5..0].

9.6.2.110 PLL2_STRG_INIT_BY1

The PLL2_STRG_INIT_BY1 Register. Return to [Register Map](#).

Table 135. Register – 0x77

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_STRG_INITVAL[15:8]	RW	0x0	PLL2 Storage-CP Init Value.

9.6.2.111 PLL2_STRG_INIT_BY0

The PLL2_STRG_INIT_BY0 Register. Return to [Register Map](#).

Table 136. Register – 0x78

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_STRG_INITVAL[7:0]	RW	0xFF	PLL2 Storage-CP Init Value.

9.6.2.112 RAILDET_UP

The Rail Detect Upper Limit. Return to [Register Map](#).

Table 137. Register – 0x7D

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:6]	RSRVD	-	-	Reserved.
[5:0]	RAILDET_UPP[5:0]	RW	0x0	Upper Rail Detection Limit.

9.6.2.113 RAILDET_LOW

The Rail Detect Lower Limit. Return to [Register Map](#).

Table 138. Register – 0x7E

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:6]	RSRVD	-	-	Reserved.
[5:0]	RAILDET_LOW[5:0]	RW	0x0	Lower Rail Detection Limit.

9.6.2.114 PLL2_AC_CTRL

The PLL2_AC_CTRL Register provides control of PLL2 Amplitude Calibration features. Return to [Register Map](#).

Table 139. Register – 0x7F

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:6]	RSRVD	-	-	Reserved.
[5]	PLL2_AC_CAL_EN	RW	1	PLL2 Amplitude Calibration Enable.
[4]	PLL2_PD_AC	RW	1	VCO Peak detector Power down. 1=off, 0=enabled.
[3:2]	PLL2_IDACSET_RECAL[1:0]	RW	0x1	PLL2 IDAC Re-Calibration Setting. When the difference between consecutive IDACSET values is greater than PLL2_IDACSET_RECAL the amplitude calibration is restarted.
[1]	PLL2_AC_REQ	RWSC	0	PLL2 Amplitude Calibration Request.
[0]	PLL2_FAST_ACAL	RW	0	PLL2 Fast Amplitude Calibration Enable.

9.6.2.115 PLL2_CURR_STOR_CELL

The PLL2_CURR_STOR_CELL Register is described below. Return to [Register Map](#).

Table 140. Register – 0x80

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_INTG[7:0]	RW	0x3	PLL2 Integral gain setting.

9.6.2.116 PLL2_AC_THRESHOLD

The PLL2_AC_THRESHOLD Register sets the Amplitude Calibration Threshold. Return to [Register Map](#).

Table 141. Register – 0x81

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:5]	RSRVD	-	-	Reserved.
[4:0]	PLL2_AC_THRESHOLD[4:0]	RW	0x0	PLL2 VCO Amplitude Calibration Threshold.

9.6.2.117 PLL2_AC_STRT_THRESHOLD

The PLL2_AC_THRESHOLD Register sets the Amplitude Calibration Starting Threshold. Return to [Register Map](#).

Table 142. Register – 0x82

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:5]	RSRVD	-	-	Reserved.
[4:0]	PLL2_AC_STRT_THRESHO LD[4:0]	RW	0x0	PLL2 VCO Amplitude Calibration Starting Threshold.

9.6.2.118 PLL2_AC_WAIT_CTRL

The PLL2_AC_WAIT_CTRL Register sets the Amplitude Calibration Wait Periods. Return to [Register Map](#).

Table 143. Register – 0x83

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:4]	PLL2_AC_CMP_WAIT[3:0]	RW	0x0	PLL2 VCO Amplitude Calibration Delay between IDAC Code Changes. Delay is equal to PLL2_AC_CMP_WAIT*4*Clock Period (Clock Period 100 ns).
[3:0]	PLL2_AC_INIT_WAIT[3:0]	RW	0x0	PLL2 VCO Amplitude Calibration Initial Comparator Delay. Delay is equal to PLL2_AC_INIT_WAIT*4*Clock Period.

9.6.2.119 PLL2_AC_JUMPSTEP

The PLL2_AC_JUMPSTEP Register provides control of the PLL2 Amplitude Calibration step size. Return to [Register Map](#).

Table 144. Register – 0x84

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:4]	RSRVD	-	-	Reserved.
[3:0]	PLL2_AC_JUMP_STEP[3:0]	RW	0xF	PLL2 IDAC Code Jump Step. When PLL2_FAST_ACAL is 1 then the IDACSET step value is set by PLL2_AC_JUMP_STEP.

9.6.2.120 PLL2_LD_WNDW_SIZE

The PLL2_LD_WNDW_SIZE Register sets the PLL2 Window Comparator Setting. Return to [Register Map](#).

Table 145. Register – 0x85

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_LD_WNDW_SIZE[7:0]	RW	0x1	PLL2 Window Comparator Size Setting. PLL2 Window comparator size after PLL2 AC Calibration and initial lock.

9.6.2.121 PLL2_LD_WNDW_SIZE_INITIAL

The PLL2_LD_WNDW_SIZE_INITIAL Register sets the PLL2 Window Comparator Initial Setting. Return to [Register Map](#).

Table 146. Register – 0x86

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_LD_WNDW_SIZE_INITIAL[7:0]	RW	0x7F	PLL2 Window Comparator Size Initial Setting. Window comparator size prior to PLL2 AC Calibration and initial lock.

9.6.2.122 PLL2_LOCKDET_CYC_CNT_BY2

The PLL2 Lock Detection Cycle Count is set by PLL2_LOCKDET_CYC_CNT_BY2, PLL2_LOCKDET_CYC_CNT_BY1 and PLL2_LOCKDET_CYC_CNT_BY0. Return to [Register Map](#).

Table 147. Register – 0x87

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_LOCKDET_CYC_CNT[23:16]	RW	0x0	PLL2 Lock detection cycle counter.

9.6.2.123 PLL2_LOCKDET_CYC_CNT_BY1

The PLL2_LOCKDET_CYC_CNT_BY1 Register sets bits [15:8]. Return to [Register Map](#).

Table 148. Register – 0x88

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_LOCKDET_CYC_CNT[15:8]	RW	0x40	PLL2 Lock detection cycle counter.

9.6.2.124 PLL2_LOCKDET_CYC_CNT_BY0

The PLL2_LOCKDET_CYC_CNT_BY0 Register sets bits [7:0]. Return to [Register Map](#).

Table 149. Register – 0x89

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_LOCKDET_CYC_CNT[7:0]	RW	0x0	PLL2 Lock detection cycle counter.

9.6.2.125 PLL2_LOCKDET_CYC_CNT_INITIAL_BY2

The PLL2 Lock Detection Initial Cycle Count is set by PLL2_LOCKDET_CYC_CNT_INITIAL_BY2, PLL2_LOCKDET_CYC_CNT_INITIAL_BY1 and PLL2_LOCKDET_CYC_CNT_INITIAL_BY0. This counter is used for initial PLL2 Lock before final Amplitude Calibration has finished. Return to [Register Map](#).

[7:0]	PLL2_LOCKDET_CYC_CNT_INITIAL[23:16]	RW	0x0	PLL2 Lock detection initial cycle counter.

9.6.2.126 PLL2_LOCKDET_CYC_CNT_INITIAL_BY1

The PLL2_LOCKDET_CYC_CNT_INITIAL_BY1 Register sets bits [15:8]. Return to [Register Map](#).

Table 151. Register – 0x8B

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_LOCKDET_CYC_CNT_INITIAL[15:8]	RW	0x40	PLL2 Lock detection initial cycle counter.

9.6.2.127 PLL2_LOCKDET_CYC_CNT_INITIAL_BY0

The PLL2_LOCKDET_CYC_CNT_INITIAL_BY0 Register sets bits [7:0]. Return to [Register Map](#).

Table 152. Register – 0x8C

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:0]	PLL2_LOCKDET_CYC_CNT_INITIAL[7:0]	RW	0x0	PLL2 Lock detection initial cycle counter.

9.6.2.128 IOCTRL_SPI0

The IOCTRL_SPI0 Register provides control of the SDIO Input/Output Driver. Return to [Register Map](#).

Table 153. Register – 0x8D

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	SPI_EN_THREE_WIRE_IF	RW	0	SPI 3-Wire Selection. 1=3-Wire, 0=4-Wire. When configured for 4-wire operation the SDO output is connected to the STATUS1 output pad.
[6:5]	RSRVD	-	-	Reserved.
[4]	SPI_SDIO_OUTPUT_MUTE	RW	0	SDIO Output Mute. When SPI_SDIO_OUTPUT_MUTE is 1 the SDIO output driver is forced to 0 if it is enabled.
[3]	SPI_SDIO_OUTPUT_INV	RW	0	SDIO Output Invert. When SPI_SDIO_OUTPUT_INV is 1 the SDIO output is inverted.
[2]	SPI_SDIO_OUTPUT_WEAK_DRIVE	RW	0	SDIO Output Weak Drive Strength. When SPI_SDIO_OUTPUT_WEAK_DRIVE is 1 the SDIO output is configured with a low slew rate.
[1]	SPI_SDIO_EN_PULLUP	RW	0	SPI SDIO Pullup Enable. When SPI_SDIO_PULLUP_EN is 1 a pullup resistor is activated.
[0]	SPI_SDIO_EN_PULLDOWN	RW	0	SPI SDIO Pulldown Enable. When SPI_SDIO_PULLDWN_EN is 1 a pulldown resistor is activated.

9.6.2.129 IOCTRL_SPI1

The IOCTRL_SPI1 Register provides control of the SCL and SCS input drivers. Return to [Register Map](#).

Table 154. Register – 0x8E

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:4]	RSRVD	-	-	Reserved.
[3]	SPI_SCL_EN_PULLUP	RW	0	SPI SCL Pullup Enable. When SPI_SCL_PULLUP_EN is 1 a pullup resistor is activated.
[2]	SPI_SCL_EN_PULLDOWN	RW	0	SPI SCL Pulldown Enable. When SPI_SCL_PULLDWN_EN is 1 a pulldown resistor is activated.
[1]	SPI_SCS_EN_PULLUP	RW	0	SPI SCS Pullup Enable. When SPI_SCS_PULLUP_EN is 1 a pullup resistor is activated.
[0]	SPI_SCS_EN_PULLDOWN	RW	0	SPI SCS Pulldown Enable. When SPI_SCS_PULLDWNEN_EN is 1 a pulldown resistor is activated.

9.6.2.130 IOTEST_SDIO

The IOTEST_SDIO Register provides control of the SDIO driver and test features. Return to [Register Map](#).

Table 155. Register – 0x8F

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	RSRVD	RW	0	Reserved.
[6]	SPI_SDIO_OUTPUT_HIZ	RW	1	SPI SDIO Output Driver High Impedance. When SPI_SDIO_OUTPUT_HIZ is set to 1 the SDIO output driver stage is disabled. Only when SPI_SDIO_IOTESTEN is 1.
[5]	SPI_SDIO_ENB_INSTAGE	RW	0	SPI SDIO Input Stage Enable BAR. When SPI_SDIO_INPUT_ENB is 0 the SDIO Input stage is enabled. Whenever SPI_SDIO_INPUT_ENB is set to 1 the SPI interface is rendered inoperable and can only be recovered by a hardware reset.
[4]	SPI_SDIO_EN_ML_INSTAGE	RW	0	SPI SDIO Input Stage Enable Multi-level. When SPI_SDIO_INPUT_ENML is 1 the input stage is configured for multi-level mode.
[3]	RSRVD	RW	0	Reserved.
[2]	SPI_SDIO_OUTPUT_DATA	RW	0	SPI SDIO Output Data. Controls the SDIO output data value when SPI_SDIO_IOTESTEN is set to 1.
[1]	SPI_SDIO_INPUT_Y12	R	0	SPI SDIO Input Y12 Value. Indicates the logic level present on the SDIO Y12 pin. This feature is currently not supported.
[0]	SPI_SDIO_INPUT_M12	R	0	SPI SDIO Input M12 Value. Indicates the logic level present on the SDIO M12 pin. This feature is currently not supported.

9.6.2.131 IOTEST_SCL

The IOTEST_SCL Register provides control of the SCL driver and test features. Return to [Register Map](#).

Table 156. Register – 0x90

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:6]	RSRVD	-	-	Reserved.

[4]	SPI_SCL_EN_ML_INSTAGE	RW	0	SPI SCL Input Stage Enable Multi-level. When SPI_SCL_INPUT_ENML is 1 the input stage is configured for multi-level mode.
[3:2]	RSRVD	-	-	Reserved.

Table 156. Register – 0x90 (continued)

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[1]	SPI_SCL_INPUT_Y12	R	0	SPI SCL Input Y12 Value. Indicates the logic level present on the SCL Y12 pin. This feature is currently not supported.
[0]	SPI_SCL_INPUT_M12	R	0	SPI SCL Input M12 Value. Indicates the logic level present on the SCL M12 pin. This feature is currently not supported.

9.6.2.132 IOTEST_SCS

The IOTEST_SCS Register provides control of the SCS driver and test features. Return to [Register Map](#).

Table 157. Register – 0x91

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:6]	RSRVD	-	-	Reserved.
[5]	SPI_SCS_ENB_INSTAGE	RW	0	SPI SCS Input Stage Enable BAR. When SPI_SCS_INPUT_ENB is 0 the SCS Input stage is enabled. Whenever SPI_SCS_INPUT_ENB is set to 1 the SPI interface is rendered inoperable and can only be recovered by a hardware reset.
[4]	SPI_SCS_EN_ML_INSTAGE	RW	0	SPI SCS Input Stage Enable Multi-level. When SPI_SCS_INPUT_ENML is 1 the input stage is configured for multi-level mode.
[3:2]	RSRVD	-	-	Reserved.
[1]	SPI_SCS_INPUT_Y12	R	0	SPI SCS Input Y12 Value. Indicates the logic level present on the SCS Y12 pin. This feature is currently not supported.
[0]	SPI_SCS_INPUT_M12	R	0	SPI SCS Input M12 Value. Indicates the logic level present on the SCS M12 pin. This feature is currently not supported.

9.6.2.133 IOCTRL_STAT0

The IOCTRL_STAT0 Register provides control of the STATUS0 Input/Output Driver. Return to [Register Map](#).

Table 158. Register – 0x92

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:5]	STATUS0_MUX_SEL[2:0]	RW	0x4	STATUS0 Output Mux Select. STATUS0_MUX_SEL– STATUS0 Output 000– PLL1 REF CLK 001– PLL2 REF CLK 010– PLL1 SYS CLK 011– PLL2 SYS CLK 1XX– Signal selected by STATUS0_INT_MUX (digital)
[4]	STATUS0_OUTPUT_MUTE	RW	0	STATUS0 Output Mute. When STATUS0_OUTPUT_MUTE is 1 the STATUS0 output driver is forced to 0 if it is enabled.
[3]	STATUS0_OUTPUT_INV	RW	0	STATUS0 Output Invert. When STATUS0_OUTPUT_INV is 1 the STATUS0 output is inverted.
[2]	STATUS0_OUTPUT_WEAK_DRIVE	RW	0	STATUS0 Output Weak drivestrength. When STATUS0_OUTPUT_WEAK_DRIVE is 1 the STATUS0 output is configured with a lower slew rate.
[1]	STATUS0_EN_PULLUP	RW	0	STATUS0 Pullup Enable. When STATUS0_PULLUPEN_EN is 1 a pullup resistor is activated.
[0]	STATUS0_EN_PULLDOWN	RW	0	STATUS0 Pulldown Enable. When STATUS0_PULLDWN_EN is 1 a pulldown resistor is activated.

9.6.2.134 IOCTRL_STAT1

The IOCTRL_STAT1 Register provides control of the STATUS1 Input/Output Driver. Return to [Register Map](#).

Table 159. Register – 0x93

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7:5]	STATUS1_MUX_SEL[2:0]	RW	0x4	STAT1 Output Mux Select. STATUS1_MUX_SEL– STATUS1 Output 000– PLL1 REF CLK 001– PLL2 REF CLK 010– PLL1 SYS CLK 011– PLL2 SYS CLK 1XX– Signal selected by STATUS1_INT_MUX (digital)

9.6.2.138 IOTEST_STAT0

The IOTEST_STAT0 Register provides control of the STATUS0 driver and test features. Return to [Register Map](#).

Table 163. Register – 0x97

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	RSRVD	RW	0	Reserved.
[6]	STATUS0_OUTPUT_HIZ	RW	0	STATUS0 Output Driver High Impedance. When STATUS0_OUTPUT_HIZ is set to 1 the STATUS0 output driver stage is disabled.

Table 163. Register – 0x97 (continued)

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[5]	STATUS0_ENB_INSTAGE	RW	1	STATUS0 Input Stage Enable BAR. When STATUS0_INPUT_ENB is 0 the STATUS0 Input stage is enabled. When STATUS0_INPUT_ENB is set to 1 the STATUS0 input stage is disabled.
[4]	STATUS0_EN_ML_INSTAGE	RW	0	STATUS0 Input Stage Enable Multi-level. When STATUS0_INPUT_ENML is 1 the input stage is configured for multi-level mode.
[3]	RSRVD	RW	0	Reserved.
[2]	STATUS0_OUTPUT_DATA	RW	0	STATUS0 Output Data. Set the STATUS0 output data value when STATUS0_IOTESTEN is 1.
[1]	STATUS0_INPUT_Y12	R	0	STATUS0 Input Y12 Value. Indicates the logic level present on the STATUS0 Y12 pin.
[0]	STATUS0_INPUT_M12	R	0	STATUS0 Input M12 Value. Indicates the logic level present on the STATUS0 M12 pin.

9.6.2.139 IOTEST_STAT1

The IOTEST_STAT1 Register provides control of the STATUS1 driver and test features. Return to [Register Map](#).

Table 164. Register – 0x98

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION
[7]	RSRVD	RW	0	Reserved.
[6]	STATUS1_OUTPUT_HIZ	RW	0	STATUS1 Output Driver High Impedance. When STATUS1_OUTPUT_HIZ is set to 1 the STATUS1 output driver stage is disabled.
[5]	STATUS1_ENB_INSTAGE	RW	1	STATUS1 Input Stage Enable BAR. When STATUS1_INPUT_ENB is 0 the STATUS1 Input stage is enabled. When STATUS1_INPUT_ENB is set to 1 the STATUS1 input stage is disabled.
[4]	STATUS1_EN_ML_INSTAGE	RW	0	STATUS1 Input Stage Enable Multi-level. When STATUS1_INPUT_ENML is 1 the input stage is configured for multi-level mode.
[3]	RSRVD	RW	0	Reserved.
[2]	STATUS1_OUTPUT_DATA	RW	0	STATUS1 Output Data. Set the STATUS1 output data value when STATUS1_IOTESTEN is 1.
[1]	STATUS1_INPUT_Y12	R	0	STATUS1 Input Y12 Value. Indicates the logic level present on the STATUS1 Y12 (high-level) pin.
[0]	STATUS1_INPUT_M12	R	0	STATUS1 Input M12 Value. Indicates the logic level present on the STATUS1 M12 (mid-level) pin.

9.6.2.140 IOCTRL_SYNC

The IOCTRL_SYNC Register provides control of the SYNC Input. Return to [Register Map](#).

Table 165. Register – 0x99

BIT NO.	FIELD	TYPE	RESET	DESCRIPTION

10 Applications and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

To assist customers in frequency planning and design of loop filters Texas Instrument's provides the [Clock Design Tool](#) and [Clock Architect](#).

10.1.1 Digital Lock Detect Frequency Accuracy

The digital lock detect circuit is used to determine PLL1 locked, PLL2 locked, and holdover exit events. A window size and lock count register are programmed to set a ppm frequency accuracy of reference to feedback signals of the PLL for each event to occur. When a PLL digital lock event occurs the PLL's digital lock detect is asserted true. When the holdover exit event occurs, the device exits holdover mode.

EVENT	PLL	WINDOW SIZE	LOCK COUNT
PLL1 Locked	PLL1	PLL1_WND_SIZE	PLL1_DLD_CNT
PLL2 Locked	PLL2	PLL2_WND_SIZE	PLL2_DLD_CNT

For a digital lock detect event to occur there must be a *lock count* number of phase detector cycles of PLLX during which the time/phase error of the PLLX_R reference and PLLX_N feedback signal edges are within the user programmable *window size*. Because there must be at least *lock count* phase detector events before a lock event occurs, a minimum digital lock event time can be calculated as *lock count* / f_{PDx} where X = 1 for PLL1 or 2 for PLL2.

By using [Equation 1](#), values for a *lock count* and *window size* can be chosen to set the frequency accuracy required by the system in ppm before the digital lock detect event occurs:

$$\text{ppm} = \frac{1\text{e}6 \times \text{PLLX_WND_SIZE} \times f_{PDx}}{\text{PLLX_DLD_CNT}} \quad (1)$$

The effect of the *lock count* value is that it shortens the effective lock window size by dividing the *window size* by *lock count*.

If at any time the PLLX_R reference and PLLX_N feedback signals are outside the time window set by *window size*, then the *lock count* value is reset to 0.

10.1.1.1 Minimum Lock Time Calculation Example

To calculate the minimum PLL2 digital lock time given a PLL2 phase detector frequency of 40 MHz and PLL2_DLD_CNT = 10,000. Then the minimum lock time of PLL2 is 10,000 / 40 MHz = 250 μ s.

10.2 Typical Application

Normal use case of the LMK04610 device is as a dual loop jitter cleaner. This section will discuss a design example to illustrate the various functional aspects of the LMK04610 device.

Figure 59. Simplified Functional Block Diagram for Dual-Loop Mode

10.2.1 Design Requirements

Given a remote radio head (RRU) type application which needs to clock some ADCs, DACs, FPGA, SERDES, and an LO. The input clock is a recovered clock which needs jitter cleaning. The FPGA clock should have a clock output on power up. A summary of clock input and output requirements are as follows:

Clock Input:

- 122.88-MHz recovered clock.

Clock Outputs:

- 1x 245.76-MHz clock for ADC
- 2x 983.04-MHz clock for DAC
- 2x 122.88-MHz clock for FPGA
- 1x 122.88-MHz clock for SERDES

It is also desirable to have the holdover feature engage if the recovered clock reference is ever lost. The following information reviews the steps to produce this design.

If JESD204B support is also required for the clock outputs, see [JEDEC JESD204B](#) for more details.

10.2.2 Detailed Design Procedure

Design of all aspects of the LMK04610 are quite involved and software has been written to assist in part selection and part programming. Contact TI for optimized loop filter settings based on the system requirement. This design procedure gives a quick outline of the process.

NOTE

This information is current as of the date of the release of this data sheet. Design tools receive continuous improvements to add features and improve model accuracy. Refer to software instructions or training for latest features.

1. Device Selection

- The key to device selection is required VCO frequency given required output frequencies. The device must be able to produce the VCO frequency that can be divided down to required output frequencies.
- The software design tools take the VCO frequency range into account for specific devices based on the application's required output frequencies.
- To understand the process better, see the [Detailed Description](#) which provides more insight into the functional blocks and programming options.

Typical Application (continued)

2. Device Configuration

There are many possible permutations of dividers and other registers to get same input and output frequencies from a device. However, consider that there are some optimizations and trade-offs. It is possible, although not assured, that some crosstalk and mixing could be created when using some dividers.

- The optimum setting attempts to maximize phase detector frequency and uses the smallest dividers settings.
- For lowest possible in-band PLL noise, maximize phase detector frequency to minimize N divide value.
- As rule of thumb, keeping the phase detector frequency approximately between $10 \times$ PLL loop bandwidth and $100 \times$ PLL loop bandwidth. A phase detector frequency less than $5 \times$ PLL bandwidth may be unstable and a phase detector frequency $> 100 \times$ loop bandwidth may experience increased lock time due to cycle slipping. However, for clock generation and jitter cleaning applications, lock time is typically not critical and large phase detector frequencies typically result in reduced PLL noise, so cycle-slipping during lock is acceptable.

10.2.2.1 PLL Loop Filter Design

Contact TI with the application requirements to get the optimized loop filter settings.

10.2.2.2 Clock Output Assignment

It is best to consider proximity of each clock output to each other and other PLL circuitry when choosing final clock output locations. Here are some guidelines to help achieve best performance when assigning outputs to specific CLKout/OScout pins.

- Group common frequencies together.
- Some clock targets require low close-in phase noise. If possible, use a VCXO based PLL1 output from OSCout/OScout* for such a clock target.
- Some clock targets require excellent noise floor performance. Outputs driven by the internal LC-VCO have the best noise floor performance. An example is an ADC or DAC.

Other device specific configuration. For LMK04610, consider the following:

- Holdover Configuration
LMK04610 provides the option to have two clock inputs. The clock priority, clock loss detection, holdover, and loss recovery can be programmed. See [Holdover](#) for more details.
- JESD204B support
To generate JESD204B compliant clocks, see [JEDEC JESD204B](#) for more details.
- Digital delay: phase alignment of the output clocks.
- Analog delay: another method to shift phases of clocks with finer resolution with the penalty of increase noise floor.

10.2.2.3 Calculation Using LCM

In this example, the LCM (245.76 MHz, 983.04 MHz, 122.88 MHz) = 983.04 MHz. A valid VCO frequency for LMK04610 is 5898.24 MHz = 6×983.04 MHz. Therefore, the LMK04610 may be used to produce these output frequencies.

10.2.2.4 Device Programming

The software tool TICS Pro for EVM programming can be used to set up the device in the desired configuration, then export a hex register map suitable for use in applications.

10.2.2.5 Device Selection

Use the WEBENCH Clock Architect Tool and enter the required frequencies and formats into the tool. To use this device, find a solution using the LMK04610.

Typical Application (continued)

10.2.2.6 Clock Architect

When viewing resulting solutions, it is possible to narrow the parts used in the solution by setting a filter. Filtering of a specific device can be done by selecting the device from the filter combo box. Also, regular expressions can be typed into filter combo box. LMK04610 will only filter for the LMK04610 device.

10.2.3 Application Curves

Table 222 lists the application curves for this device.

10.3 Do's and Don'ts

10.3.1 Pin Connection Recommendations

- **V_{CC} Pins and Decoupling:** all V_{CC} pins must always be connected.
- **Unused Clock Outputs:** leave unused clock outputs floating and powered down.
- **Unused Clock Inputs:** unused clock inputs can be left floating.

12 Layout

12.1 Layout Guidelines

Power consumption of the LMK0461x family of devices can be high enough to require attention to thermal management. For reliability and performance reasons the die temperature should be limited to a maximum of 125°C .

The device package has an exposed pad that provides the primary heat removal path to the printed-circuit board (PCB). To maximize the heat dissipation from the package, a thermal landing pattern including multiple vias to a ground plane must be incorporated into the PCB within the footprint of the package. The exposed pad must be soldered down to ensure adequate heat conduction out of the package. [Figure 61](#) shows a recommended land and via pattern.

12.1.1 CLKin and OSCin

If differential input (preferred) is used route traces tightly coupled. If single-ended, have at least 3 trace width (of CLKin or OSCin trace) separation from other RF traces. Place terminations close to IC.

12.1.2 CLKout

Normally differential signals must be routed tightly coupled to minimize PCB crosstalk. Trace impedance and terminations must be designed accord to output type being used. Unused outputs must be left open and programmed to power-down state.

12.2 Layout Example

Figure 61. Recommended PCB Layout

1. CLK_{in} and OSC_{in} path:
 - If differential input (preferred), route traces tightly coupled. If single ended, have at least 3 trace width (of CLK_{in}/OSC_{in} trace) separation from other RF traces.
2. CLK_{outs}/OSC_{outs}:
 - Normally differential signals should be routed tightly coupled to minimize PCB crosstalk. Trace impedance must be designed according to 100-Ω differential. For optimal isolation place different clock group signals on different layers.
3. VCXO connection
 - Shorter traces are better. Place a resistors and capacitors closer to IC except for a single capacitor and associated resistor, if any, next to VCXO. If any, place loop filter components close to VCXO V_{tune} pin.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5-1994.
 - B. This drawing is subject to change without notice.
 - C. QFN (Quad Flatpack No-Lead) Package configuration.
 - D. The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - F. Package complies to JEDEC MO-220.

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
