An ON Semiconductor Company

LV5219LG — **Bi-CMOS IC For cell phone LED driver**

Overview

The LV5219LG is an LED driver IC for cellular phones. It incorporates 17 LED drivers (main, sub, tricolor × 2, and flash) and a switching regulator circuit and supports the step-up through mode. Each LED current level can be adjusted over the I²C serial bus. The LED driver IC also has functions to synchronize a ringing tone with a tricolor LED and to automatically control the brightness of white LEDs by brightness sensor.

Functions

- PWM switching regulator control circuit
 - (Triangular wave oscillator, reference voltage, PWM comparator, driver, DTC, and short-circuit protection circuit incorporated)
 - (Timer-latch type output cut-off circuit in case of overload)
- LED driver
 - Main LCD backlight LED driver × 6 with automatic brightness adjustment
 - LED current 5-bit changeover 0.0mA to 18.6mA
 - Fade in/out function
 - External brightness control function
 - Dim mode 3-bit changeover 0mA to 1.4mA
 - MLED4, MLED5, and MLED6 can be controlled independently
 - Sub LCD backlight LED driver × 2
 - LED current 5-bit changeover 0.0mA to 18.6mA
 - Fade in/out function
 - Independently controlled SLED2
 - Tricolor LED driver × 2
 - LED current 5-bit changeover 0.0mA to 18.6mA
 - Gradation function
 - Ringing tone synchronization function (Forced to operate at SCTL : H)
 - Flash LED driver × 3
 - LED current 5-bit changeover 0.0mA to 18.6mA
 - Independent control

- Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.
- Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Specifications

Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	VCC max		6	V
Allowable power dissipation	Pd max	Mounted on a board *	1.2	W
Operating temperature	Topr		-30 to +85	°C
Storage temperature	Tstg		-40 to +125	°C

* Designated board : 40mm×50mm×0.8mm, glass epoxy 4-layer board (2S2P)

Recommended Operating Conditions at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage 1	VBAT		2.7 to 4.5	V
Supply voltage 2	VDD		1.65 to 3	V
Supply voltage 3	VDD2		1.65 to 3	V

* Use the IC so that supply voltages 1, 2, and 3 have a magnitude relationship expressed as $\text{VBAT} > \text{VDD}$ and $\text{VBAT} > \text{VDD2}$.

* Powers must be turned on so that VBAT brings up first.

* Powers must be turned off so that VBAT brings down last.

Electrical Characteristics $T_a = 25^\circ\text{C}$, $\text{VBAT} = 3.7\text{V}$, $\text{VDD} = \text{VDD2} = 2.6\text{V}$

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
VBAT system (PVBAT, SVBAT) consumption current	I _{CC1}	RESET : L (standby mode)		0	5	µA
	I _{CC2}	RESET : H (sleep mode)		0.3	5	µA
	I _{CC3}	When the switching regulator is operated.		1.5	2.5	mA
	I _{CC4}	Switching regulator operation LED : ON current set to 0		1.5	2.5	mA
V _{DD} system (V _{DD}) consumption current	I _{CC5}	RESET : L (standby mode)		0	5	µA
	I _{CC6}	RESET : H (sleep mode)		0	5	µA
	I _{CC7}	When the switching regulator is operated.		0	5	µA
	I _{CC8}	Switching regulator operation LED : ON current set to 0		0	5	µA
V _{DD} system (V _{DD2}) consumption current	I _{CC9}	RESET : L (standby mode)		0	5	µA
	I _{CC10}	RESET : H (sleep mode)		0	5	µA
	I _{CC11}	When the switching regulator is operated.		0	5	µA
	I _{CC12}	Switching regulator operation LED : ON current set to 0		0	5	µA
Switching regulator block						
Output voltage 1	V _{O1}	$I_O = 30\text{mA}$, when output set to 5V	4.8	5.0	5.2	V
LED pin voltage	V _{O2}	LED pin voltage Lowest voltage of feed back mode LED pin voltages MLED1, 2, 3, 4, 5, and 6 (except when MLED4, MLED5, and 6 are controlled independently)	0.2	0.3	0.4	V
Clock frequency	f _{OSC}	External capacitance value connected to CT pin is 27pF	0.8	1	1.2	MHz
Changeover voltage	VD1	Voltage for switching from through mode to LED pin fixed voltage mode when the LED pin voltage main current value is set to 18.6mA		0.2		V
Changeover monitoring time	TVD1	Time interval predetermined to detect error for the LED pin voltage when operation is switched over to stepping up with the detection of LED pin voltage.	50		120	µs
Soft start time	TST				1000	µs
Through SW ON resistance	RTH	Load = 100mA		1		Ω

Block Diagram

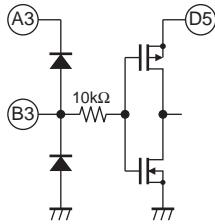

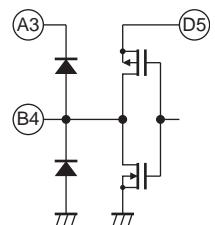

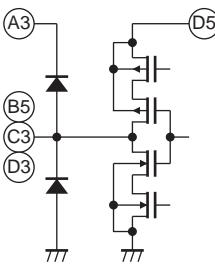

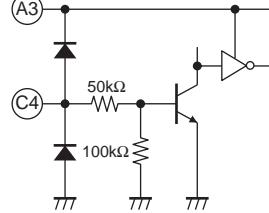

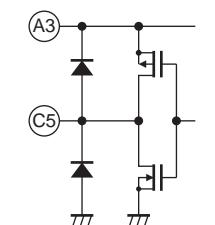

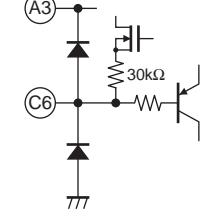

Pin Functions

Pin No.	Pin name	Pin Description	Equivalent Circuit
A1	TEST	Test signal input pin. Be sure to connect the pin to GND.	
A2	CT	Oscillator frequency setting capacitance connection pin. Triangular wave output is generated by connecting an external capacitor across this pin and GND. The clock frequency of the switching regulator and the LED on/off fade time can be adjusted by changing the value of the external capacitor.	
A3	SVBAT	Power pin for analog circuit.	
A4	IN	DC/DC feedback voltage input pin. Feedback is applied so that the input voltage becomes equal to the set voltage in the output voltage fixed mode. Overvoltage limiter is activated when the input voltage rises about 0.6V higher than the fixed mode set voltage. When the input voltage falls, the switching regulator is stopped in about 10ms. This condition is released by resetting the IC or setting the serial RGSW to OFF.	
A5	PVBAT	Power pin for DC/DC pulse output driver.	
A6	SWOUT	DC/DC PWM pulse output pin. The on resistance of both output transistors PCH and NCH are about 10Ω.	
B1	MLED_F	MLED filter capacitor connection pin.	
B2	MICTL	MLED external brightness control pin. The main LED normal current value can be varied by applying a DC voltage to this pin. The set current value is obtained when VDD2 voltage is applied. The main LED normal current decreases as the voltage is lowered. The level of current change can be varied by the value of external resistor connected to the RT2 pin.

LV5219LG

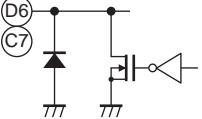

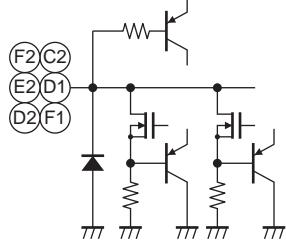

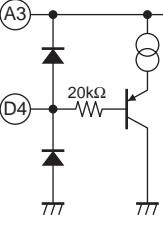

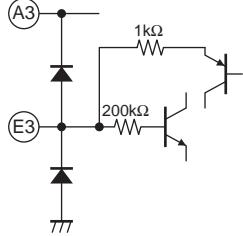

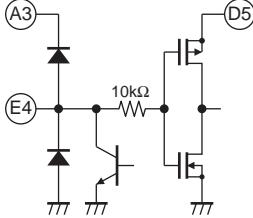

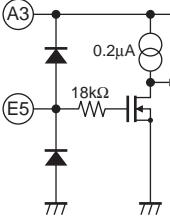

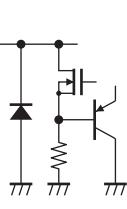

Continued from preceding page.

Pin No.	Pin name	Pin Description	Equivalent Circuit
B3	SCL	Serial clock signal input pin.	
B4	INT	Interrupt signal output pin.	
B6	V _{DD2}	Reference power for MLED external sync circuit.	
B7	PGND	DC/DC pulse output driver GND pin.	
C1	SGND	Analog circuit GND pin.	
B5 C3 D3	GPO0 GPO1 GPO2	General-purpose output pins.	
C4	SCTL	RGBLED external sync signal input pin. When the serial R1SW, G1SW, and B1SW, G2SW, and B2SW are set to ON, setting the application voltage H causes tricolor LED to go ON. When the application voltage set to L, tricolor LED goes OFF. Note that if the serial settings SCSW1 and SCSW2 are set to "ignore SCTL," tricolor LED goes ON regardless of the state of SCTL.	
C5	PTEN	Brightness sensor ON/OFF control pin.	
C6	RT	Reference current setting resistor connection pin. By connecting the external resistor between this pin and GND, the reference current is generated. The pin voltage is about 0.25V. Change of this current value enables change of the oscillation frequency and LED driver current value.

Pin No.	Pin name	Pin Description	Equivalent Circuit
D6 C7	KLED1 KLED2	Key LED driver output pins.	
C2 D1 F1 F2 E2 D2	MLED1 MLED2 MLED3 MLED4 MLED5 MLED6	Main LCD backlight LED driver pin. Feedback is applied so that the current flow through the output transistor becomes equal to the set current value. The driver current value can be adjusted in 0.6mA steps from about 0.6mA to 18.6mA through serial setting. These pins are also used to switch from through to switching regulator mode and to sense the feedback of the output voltage to the LED pins.	
D4	PTD	Brightness sensor output connection pin. Used to determine the brightness according to the DC input voltage. Must be connected to GND when not to be used.	
D5	V _{DD}	Power pin for IF.	
D7	LEDGND3	LED driver dedicated GND pin 3	
E1	LEDGND1	LED driver dedicated GND pin 1	
E3	RT2	Reference current setting resistor connection pin used when MLED is controlled externally. The resistance value of the external resistor connected to the V _{DD2} pin can set a variable value of the main LED normal mode current that is varied with the MICTL pin.	
E4	SDA	Serial data signal input pin.	
E5	RESET	Reset signal input pin. Reset state when low.	
E7 F7 E6	FLED1 FLED2 FLED3	Flash LED driver pins. Feedback is applied so that the current flow through the output transistor becomes equal to the set current value. Each driver output current value can be adjusted independently with the 0.6 step from about 0.8mA to 18.6mA through serial setting.

Pin No.	Pin name	Pin Description	Equivalent Circuit
F3 F4 G5 F5 F6 G6	RLED1 RLED2 GLED1 GLED2 BLED1 BLED2	Tricolor LED driver pins. Feedback is applied so that the current flow through the output transistor becomes equal to the set current value. Each driver output current value can be adjusted independently with the 0.6 step from about 0.8mA to 18.6mA through serial setting. These pins are turned ON only when the SCTL pin is set high or the serial SCTEN and SCSW2 pins are set to ignore SCTL.	
G3 G2	SLED1 SLED2	Sub-LED backlight LED driver pins. Feedback is applied so that the current flow through the output transistor becomes equal to the set current value. The driver output current value can be adjusted independently with the 0.6 step from about 0.8mA to 18.6mA through serial setting.	
G4	LEDGND2	LED driver dedicated GND pin 2.	
G7 A7 G1	TEST1 TEST2 TEST3	Test signal input pin. Be sure to connect the pin to GND.

I²C bus transmission method

Start and stop conditions

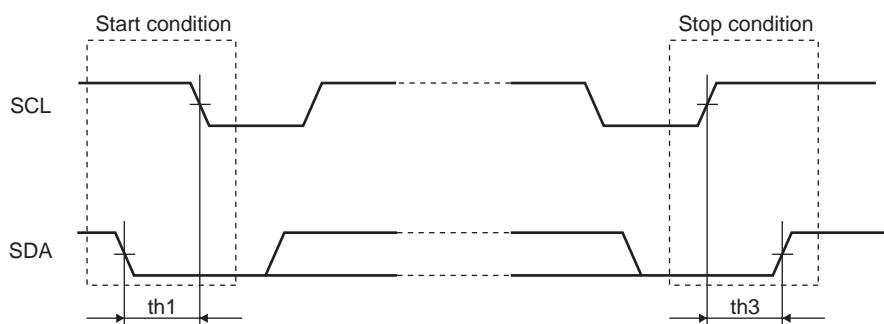

In the I²C bus, SDA must basically be kept in the constant state while SCL is "H" as shown below during data transfer.

When data transfer is not made, both SCL and SDA are in the "H" state.

When SCL = SDA = "H", change of SDA from "H" to "L" enables the start conditions to start access.

When SCL is "H", change of SDA from "L" to "H" enables the stop conditions to stop access.

Data transfer and acknowledgement response

After establishment of start conditions, data transfer is made by one byte (8 bits).

Data transfer enables continuous transfer of any number of bytes.

Each time the 8-bit data is transferred, the ACK signal is sent from the receive side to the send side.

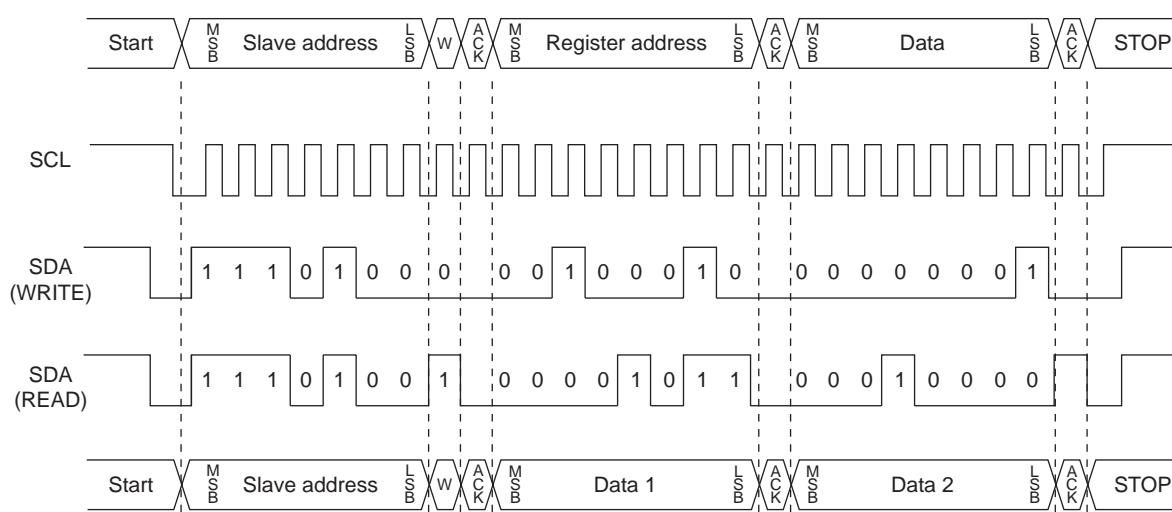

The ACK signal is issued when SDA on the send side is released and SDA on the receive side is set "L" immediately after fall of the clock pulse at the SCL eighth bit of data transfer to "L".

When the next 1-byte transfer is left in the receive state after transmission of the ACK signal from the receive side, the receive side releases SDA at fall of the SCL ninth clock.

In the I²C bus, there is no CE signal. Instead, 7-bit slave address is assigned to each device and the first byte of transfer is assigned to the command (R/W) representing the 7-bit slave address and subsequent transfer direction.

The 7-bit address is transferred sequentially from MSB and the second byte is WRITE when the eighth bit is "L" and READ when the eighth bit is "H".

In LV5219LG, the slave address is specified as (1110100).

Data transfer write format

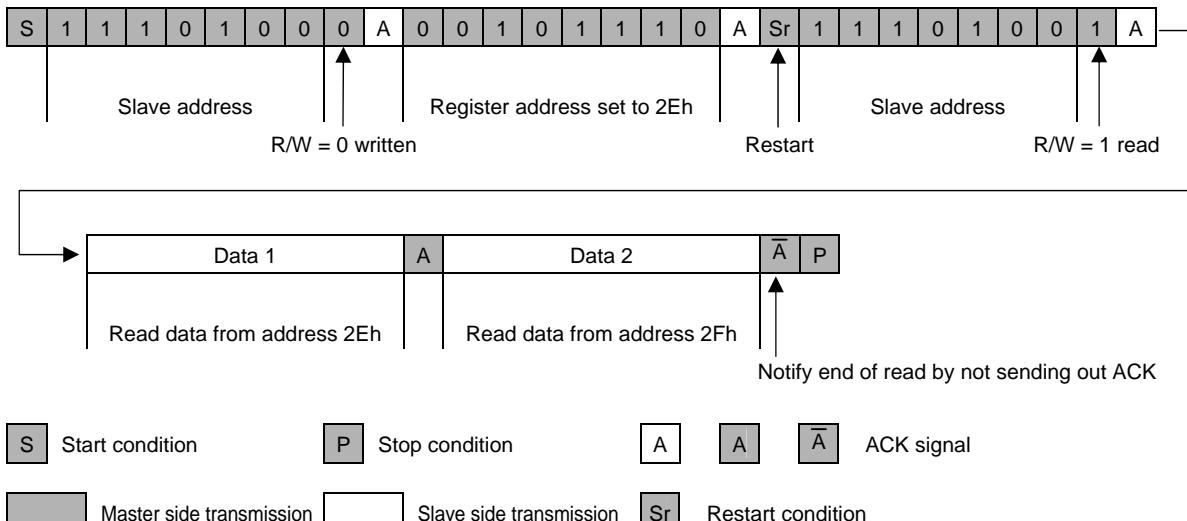

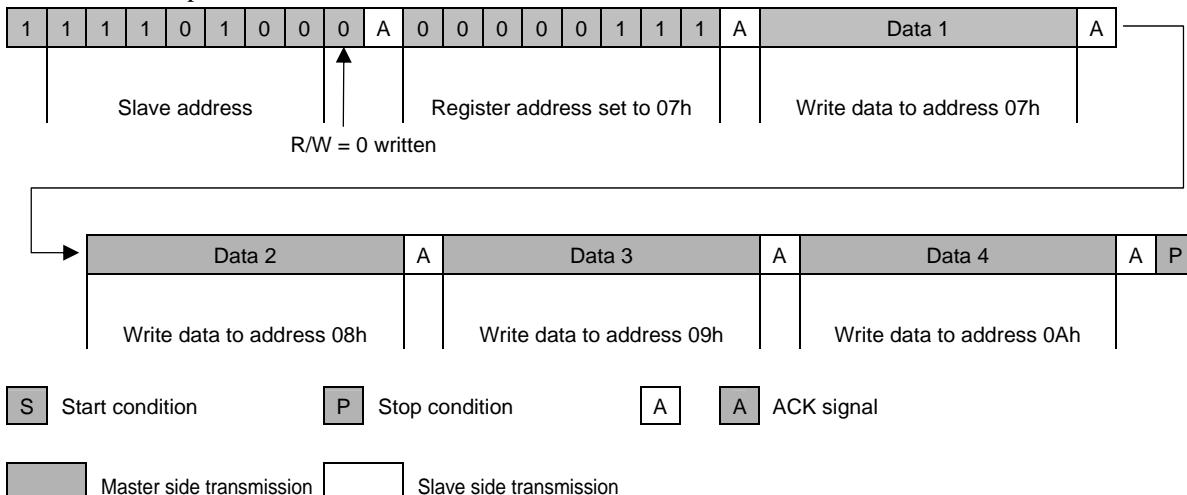

The slave address and Write command must be allocated to the first byte and the register address in the serial map must be designated in the second byte.

For the third byte, data transfer is carried out to the address designated by the register address which is written in the second byte. Subsequently, if data continues, the register address value is automatically incremented for the fourth and subsequent bytes.

Thus, continuous data transfer starting at the designated address is made possible.

After the register address reaches 7Fh, the transfer address for the next byte is set to 00h.

Data write example

Serial modes setting

address : 00h (LEDCTL) LED Setting 1 Register Write

00h (LEDCTL)	D7	D6	D5	D4	D3	D2	D1	D0

1 : ON

D7 : SCSW2 (SCTL signal enable 2 RLED2, GLED2, BLED2 setting)

0 : SCTL enabled *Default

1 : SCTL disabled

*SCTL is the external sync pin input used for the synchronization with the sound signal from the sound source IC. It turns on and off the tricolor LEDs.

*The SCTL signal can be enabled or disabled with the SCTL signal enable setting.

The relationships among SCSW, SCTL, and RLED, GLED, and BLED are shown below.

SCSW1	SCTL pin	RLED1, GLED1, BLED1 State	
0	L	Turn off	Forced off regardless of the serial command when set to turn off.
0	H	Turn-on enable	When set to "turn-on enable," the LEDs can be turned on with the serial command R1SW, G1SW, or B1SW, or can be automatically turned on and off in the gradation/pulse mode.
1	L	Turn-on enable	
1	H	Turn-on enable	

SCSW2	SCTL pin	RLED2, GLED2, BLED2 State	
0	L	Turn off	Forced off regardless of the serial command when set to turn off.
0	H	Turn-on enable	When set to "turn-on enable," the LEDs can be turned on with the serial command R2SW, G2SW, or B2SW, or B1SW, or can be automatically turned on and off in the gradation/pulse mode.
1	L	Turn-on enable	
1	H	Turn-on enable

42h (GPOCTL)	D7	D6	D5	D4	D3	D2	D1	D0
Register name	MFXSW	-	GPO22	GPO12	GPO02	GPO21	GPO11	GPO01
R/W	W	W	W	W	W	W	W	W
Default	0	0	0	0	0	0	0	0

D0 : GPO01 (GPO0 output setting 1)

0 : Low output *Default

1 : High output

D1 : GPO11 (GPO1 output setting 1)

0 : Low output *Default

1 : High output

D2 : GPO21 (GPO2 output setting 1)

0 : Low output *Default

1 : High output

D3 : GPO02 (GPO0 output setting 2)

0 : OPEN *Default

1 : Buffer output

D4 : GPO12 (GPO1 output setting 2)

0 : OPEN *Default

1 : Buffer output

D5 : GPO22 (GPO2 output setting 2)

0 : OPEN *Default

1 : Buffer output

D7 : MFXSW (Step-up mode settings in which LED pins are set to the same level)

0 : Turns on the step-up mode in which the LED pins are set to the predetermined voltage level when the voltage at the MLED pins goes down and a mode change from through to step-up occurs.
*Default

1 : Turns on the fixed voltage output mode when the voltage at the MLED pins goes down and a mode change from through to step-up occurs.

Precautions for serial transmission and use

- * When the switching regulator is to be started, the LED driver must be turned off.
- * When the MLED4, 5 and 6 settings are to be turned on as the main LED drivers, either MLED4, MLED5, and MLED6 must be turned off after fade out, or they must be set to “always ON.”
- * When the SLED2 setting is to be turned on as the SLED driver, either SLED2 must be turned off after fade out, or it must be set to “always ON.”
- * When LED pins are not to be used
When no LED is to be connected to the LED pin, the LED driver pin must be connected to VBAT.
- * Thermal shutdown operation
At a high temperature, the thermal shutdown is activated. In this case, all of the LEDs are turned off, and the voltage stepping-up operation is stopped.
The serial registers are held in the HOLD state. When the temperature goes down to the normal level, the IC self-restores.
However, the IC will not self-restore if the short-circuit prevention circuit (SCP) is activated when DC/DC circuit is turned off.
- * IN pin H limit operation
When the IN pin becomes approximately 0.6V higher than the DC/DC set voltage, the H limit operation is triggered.
H limit operation causes DC/DC circuit to stop the voltage stepping-up operation, but when the voltage falls to the normal level, the IC self-restores.
The H limit voltage becomes approximately 0.6V higher than the fixed mode set voltage and varies when the set voltage changes. When the set voltage is 4.3V, the H limit voltage will be approximately 4.9V, and when the set voltage is approximately 5.0V, the H limit voltage will be approximately 5.6V.
H limit operation is also effective in a mode in which the LED pin voltage is made constant, so in this mode as well a fixed mode output voltage must be set in consideration of the H limit voltage.
- * RESET serial communication
The RESET pin must be cleared (L→H) after VBAT is started.
VDD and VDD2 are unrelated to the RESET function.
Serial communication does not take place until VDD is started after RESET is released. When voltage VDD does not exist, no communication can be carried out and RESET is not triggered, either.
The registers hold their state.
- * Regarding the switching regulator short-circuit protection circuit (SCP)
When the switching regulator output falls, it is assumed that a short circuit has occurred, and the SCP is activated to prevent an excessively large current from flowing. When the IN pin voltage falls by about 30mV from the no-load output value, an internal timer operates. If the reduced voltage condition continues for 10msec, the LV5219LG will judge that a short circuit has occurred, and stop the switching regulator control circuit.
After the switching regulator control circuit has stopped, it does not self-restore. However, it can be reset by either applying a RESET, or sending a command to set the serial control RGSW to 0.

In a mode in which the LED pin voltage is made constant, the same operation takes place when the MLED pin voltage falls by 60mV, and the SCP is activated. As in the case of the constant voltage mode, a self-restore does not take place, and the resetting method is also the same.

- SANYO Semiconductor Co.,Ltd. assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein.
- SANYO Semiconductor Co.,Ltd. strives to supply high-quality high-reliability products, however, any and all semiconductor products fail or malfunction with some probability. It is possible that these probabilistic failures or malfunction could give rise to accidents or events that could endanger human lives, trouble that could give rise to smoke or fire, or accidents that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO Semiconductor Co.,Ltd. products described or contained herein are controlled under any of applicable local export control laws and regulations, such products may require the export license from the authorities concerned in accordance with the above law.
- No part of this publication may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying and recording, or any information storage or retrieval system, or otherwise, without the prior written consent of SANYO Semiconductor Co.,Ltd.
- Any and all information described or contained herein are subject to change without notice due to product/technology improvement, etc. When designing equipment, refer to the "Delivery Specification" for the SANYO Semiconductor Co.,Ltd. product that you intend to use.
- Information (including circuit diagrams and circuit parameters) herein is for example only; it is not guaranteed for volume production.
- Upon using the technical information or products described herein, neither warranty nor license shall be granted with regard to intellectual property rights or any other rights of SANYO Semiconductor Co.,Ltd. or any third party. SANYO Semiconductor Co.,Ltd. shall not be liable for any claim or suits with regard to a third party's intellectual property rights which has resulted from the use of the technical information and products mentioned above.

This catalog provides information as of January, 2009. Specifications and information herein are subject to change without notice.
