

8-BIT SHIFT REGISTER | \$54166

S54166 N74166

\$54166-B,F,W • N74166-B,F

DIGITAL 54/74 TTL SERIES

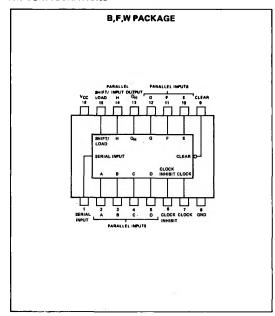

DESCRIPTION

These 8-bit shift registers are compatible with most other TTL, DTL, and MSI logic families. All inputs are buffered to lower the drive requirements to one normalized Series 54/74 load, and input clamping diodes minimize switching transients to simplify system design. Maximum input clock frequency is typically 35 megahertz and power dissipation is typically 360 mW.

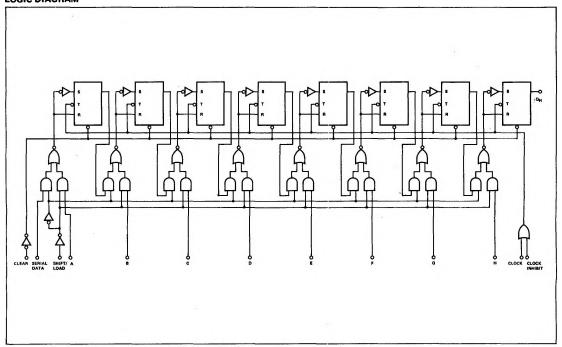

All Series 54 devices are characterized for operation over the full military temperature range of -55°C to 125°C. Series 74 devices are characterized for operation from 0°C to 70°C.

These parallel-in or serial-in, serial-out shift registers have a complexity of 77 equivalent gates on a monolithic chip. They feature gated clock inputs and an overriding clear input. The parallel-in or serial-in modes are established by the shift/load input. When high, this input enables the serial data input and couples the eight flip-flops for serial shifting with each clock pulse. When low, the parallel (broadside) data inputs are enabled and synchronous loading occurs on the next clock pulse. During parallel loading, serial data flow is inhibited. Clocking is accomplished on the low-to-high-level edge of the clock pulse through a two-input positive NOR gate permitting one input to be used as a clock-enable or clock-inhibit function. Holding either of the clock inputs high inhibits clocking; holding either low enables the other clock input. This, of course, allows the system clock to be free-running and the register can be stopped on command with the gate input. The clock-inhibit input should be changed to the high level only while the clock input is high. A buffered, direct clear input overrides all other inputs, including the clock and sets all flip-flops to zero. Average power dissipation per gate is typically 4.7 mW.

PIN CONFIGURATIONS

LOGIC DIAGRAM

RECOMMENDED OPERATING CONDITIONS

		S54166	_		N74166		UNIT
	MIN	NOM	MAX	MIN	NOM	MAX	0.4.1
Supply Voltage V _{CC}	4.5	5	5.5	4.75	5	5.25	V
Normalized Fan-Out from each Output, N: High logic level			20	Ì		20	
Low logic level	1		10	l	1	10	
Input Count Frequency, f _{count}	0	ļ	25	0		25	MHz
Width of Clock or Clear Pulse, tw	20			20			ns
Mode-Control Setup Time, t _{setup}	30			30			ns
Data Setup Time, t _{setup}	20		Ì	20			ns
Hold Time at any Input, thold	0			0	}		ns
Operating Free-Air Temperature, TA	-55	25	125	0	25	70	°c

ELECTRICAL CHARACTERISTICS (over recommended operating free-air temperature range unless otherwise noted)

	PARAMETER	TEST CON	DITIONS *	S	54166			N7416	6	
				MIN	TYP#	MAX	MIN	TYP:	MAX	UNIT
VIH	High-level input voltage			2			2			V
v_{IL}	Low-level input voltage			ŀ		0.8			0.8	v
