

8-BIT OTP/EPROM MCUs WITH A/D CONVERTER

- 3.0 to 6.0V Supply Operating Range
- 8 MHz Maximum Clock Frequency
- -40 to +85°C Operating Temperature Range
- Run, Wait and Stop Modes
- 5 Interrupt Vectors
- Look-up Table capability in OTP/EPROM
- Data OTP/EPROM: User selectable size (in program EPROM)
- Data RAM: 64 bytes
- 12/20 I/O pins, fully programmable as:
 - Input with pull-up resistor
 - Input without pull-up resistor
 - Input with interrupt generation
 - Open-drain or push-pull output
 - Analog Input
- 4 I/O lines can sink up to 20mA to drive LEDs or TRIACs directly
- 8-bit Timer with 7-bit programmable prescaler and external input
- Digital Watchdog
- 8-bit A/D Converter with 8 (ST62T10, T20, E20) or 16 (ST62T15, T25, E25) analog inputs
- On-chip Clock oscillator can be driven by Quartz crystal or Ceramic resonator
- Power-on Reset
- One external Non-Maskable Interrupt
- ST626x-EMU Emulation and Development System (connects to an MS-DOS PC via an RS232 serial line).

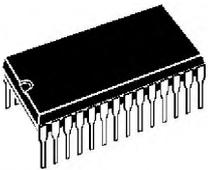

DEVICE SUMMARY

1 GENERAL DESCRIPTION

1.1 INTRODUCTION

The ST62T10, T15, T20 and T25 devices are low cost members of the 8-bit HCMOS ST62xx family of microcontrollers, which is targeted at low to medium complexity applications. All ST62xx devices are based on a building block approach: a common core is surrounded by a number of on-chip peripherals.

The ST62E20 device is an erasable EPROM version of the ST62T20 device, which may be used to emulate the T10 and T20 devices, as well as the respective ST6210B and 20B ROM devices.

The ST62E25 device is an erasable EPROM version of the ST62T25 device, which may be used to emulate the T15 and T25 devices, as well as the respective ST6215B and 25B ROM devices.

OTP and EPROM devices are functionally identical. The ROM based versions offer the following additional features: RC Oscillator, Oscillator Safe-

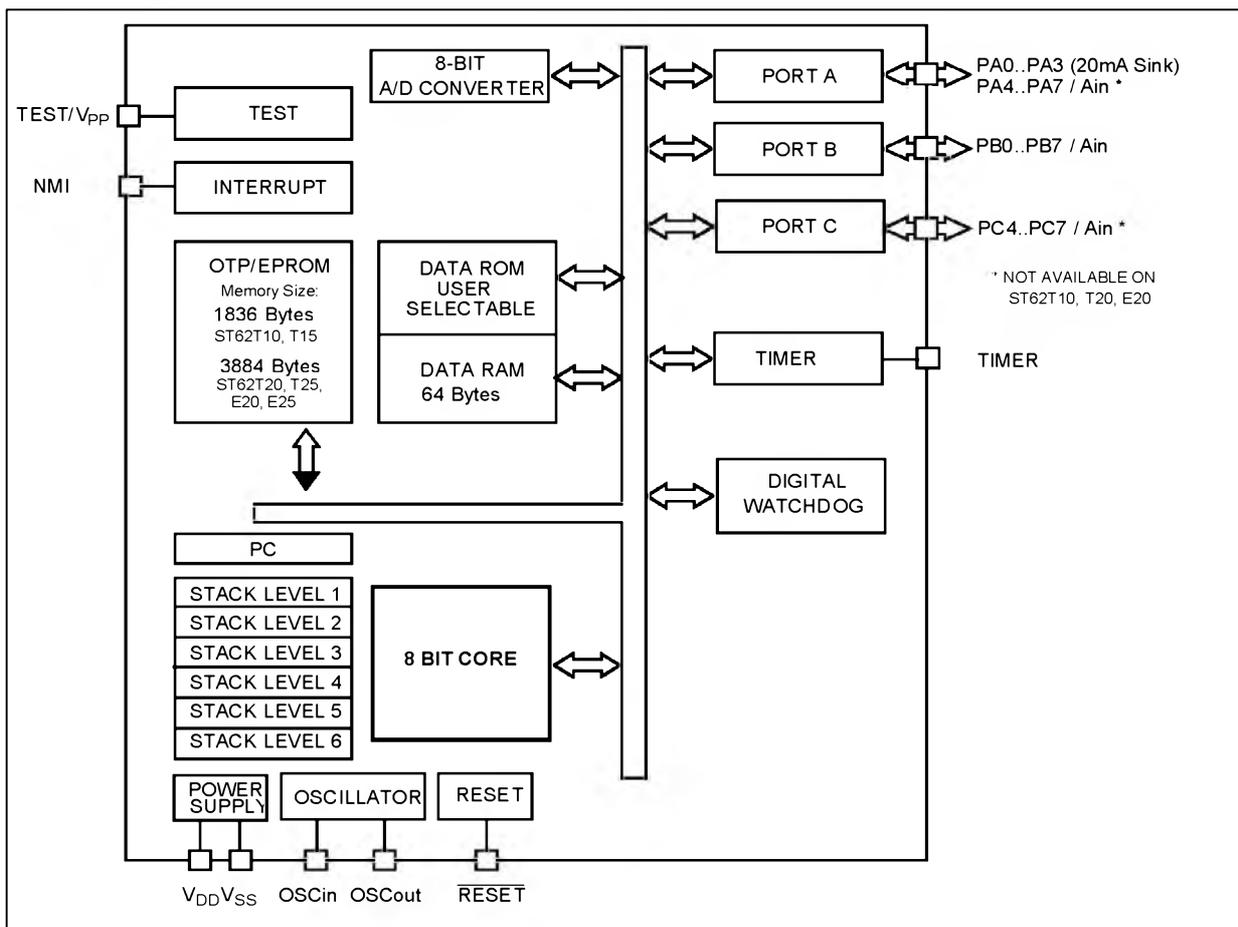

guard, external Stop mode control, program code readout protection and the possibility of having an internal pullup on the NMI and TIMER pins.

OTP devices offer all the advantages of user programmability at low cost, which make them the ideal choice in a wide range of applications where frequent code changes, multiple code versions or last minute programmability are required.

EPROM devices, thanks to their ease of erasure and reprogrammability, are best suited for program development and evaluation.

These compact low-cost devices feature a Timer comprising an 8-bit counter and a 7-bit programmable prescaler, an 8-bit A/D Converter with 8/16 analog inputs and a Digital Watchdog timer, making them well suited for a wide range of automotive, appliance and industrial applications.

Figure 1. Block Diagram

1.2 PIN DESCRIPTION

V_{DD} and V_{SS}. Power is supplied to the MCU via these two pins. V_{DD} is the power connection and V_{SS} is the ground connection.

OSCin and OSCout. These pins are internally connected to the on-chip oscillator circuit. A quartz crystal, a ceramic resonator or an external clock signal can be connected between these two pins. The OSCin pin is the input pin, the OSCout pin is the output pin.

RESET. The active-low RESET pin is used to re-start the microcontroller.

TEST/V_{PP}. The TEST must be held at V_{SS} for normal operation. If TEST pin is connected to a +12.5V level during the reset phase, the EPROM programming Mode is entered.

NMI. The NMI pin provides the capability for asynchronous interruption, by applying an external non maskable interrupt to the MCU. The NMI input is falling edge sensitive. A pull-up device must be provided externally on OTP and EPROM devices.

TIMER. This is the timer I/O pin. In input mode it is connected to the prescaler and acts as external timer clock input or as control gate input for the internal timer clock. In output mode the timer pin outputs the data bit when a time-out occurs. A pull-up device must be provided externally on OTP and EPROM devices.

PA0-PA3,PA4-PA7. These 8 lines are organized as one I/O port (A). Each line may be configured under software control as inputs with or without internal pull-up resistors, interrupt generating inputs with pull-up resistors, open-drain or push-pull outputs. PA0-PA3 can also sink 20mA for direct LED driving while PA4-PA7 can be programmed as analog inputs for the A/D converter.

Note: PA4-PA7 are not available on ST62T10, T20 or E20.

PB0-PB7. These 8 lines are organized as one I/O port (B). Each line may be configured under software control as inputs with or without internal pull-up resistors, interrupt generating inputs with pull-up resistors, open-drain or push-pull outputs, or as analog inputs for the A/D converter.

PC4-PC7. These 4 lines are organized as one I/O port (C). Each line may be configured under software control as inputs with or without internal pull-up resistors, interrupt generating inputs with pull-up resistors, open-drain or push-pull outputs, or as analog inputs for the A/D converter.

Note: PC4-PC7 are not available on ST62T10, T20 or E20.

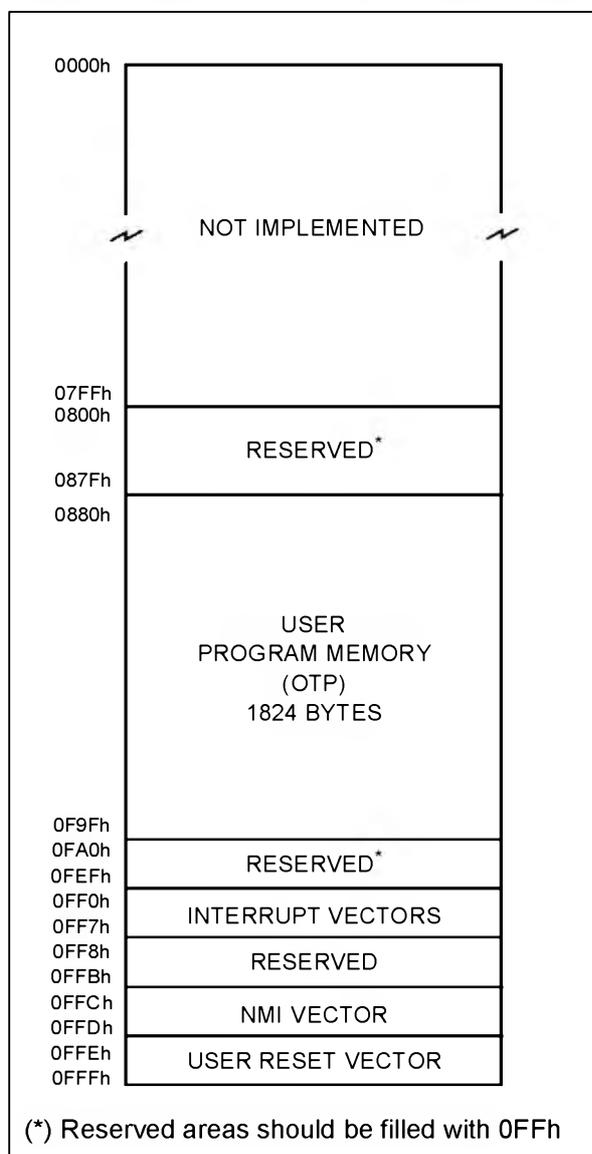

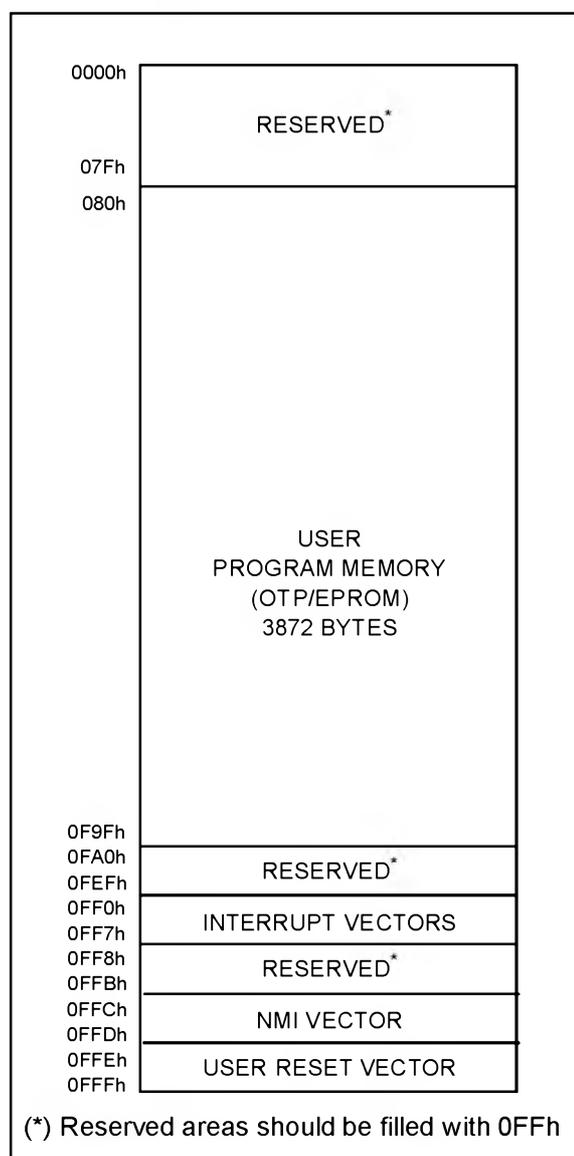

Figure 5. ST62T20, T25, E20, E25 Program Memory Map

1.3.2 Data Space

Data Space accommodates all the data necessary for processing the user program. This space comprises the RAM resource, the processor core and peripheral registers, as well as read-only data such as constants and look-up tables in OTP/EPROM.

The Data Space is fully described and illustrated on page 21.

1.4 PARTICULARITIES OF OTP AND EPROM DEVICES

OTP and EPROM devices are identical save for the package which, in the EPROM device, is fitted with a transparent window to allow erasure of memory contents by exposure to UV light.

Both OTP and EPROM parts may be programmed using programming equipment approved by SGS-THOMSON.

1.4.1 OTP/EPROM Programming

Programming mode is selected by applying a 12.5V voltage to the $V_{PP}/TEST$ pin during reset. Programming of OTP and EPROM parts is fully described in the EPROM Programming Board User Manual.

1.4.2 Eprom Erasure

Thanks to the transparent window present in the EPROM package, its memory contents may be erased by exposure to UV light.

Erasure begins when the device is exposed to light with a wavelength shorter than 4000Å. It should be noted that sunlight, as well as some types of artificial light, includes wavelengths in the 3000-4000Å range which, on prolonged exposure, can cause erasure of memory contents. It is thus recommended that EPROM devices be fitted with an opaque label over the window area in order to prevent unintentional erasure.

The recommended erasure procedure for EPROM devices consists of exposure to short wave UV light having a wavelength of 2537Å. The minimum recommended integrated dose (intensity x exposure time) for complete erasure is 15Wsec/cm². This is equivalent to an erasure time of 15-20 minutes using a UV source having an intensity of 12mW/cm² at a distance of 25mm (1 inch) from the device window.

2 CENTRAL PROCESSING UNIT

2.1 INTRODUCTION

The CPU Core may be thought of as an independent central processor communicating with on-chip I/O, memory and peripherals. For further details refer to page 18.

2.2 CPU REGISTERS

The CPU Core features six registers and three pairs of flags available to the programmer. For a detailed description refer to page 24.

3 CLOCKS, RESET, INTERRUPTS AND POWER SAVING MODES

3.1 CLOCK SYSTEM

The Oscillator may be driven by an external clock, or by a crystal or ceramic resonator. ROM devices also offer RC oscillator and Oscillator Safeguard features. For a complete description refer to page 26.

3.2 RESETS

The MCU can be reset in three ways: by the external Reset input being pulled low, by the Power-on Reset circuit, or by the Digital Watchdog timing out. For further details refer to page 30.

3.3 DIGITAL WATCHDOG

The Digital Watchdog can be used to provide controlled recovery from software upsets. Software and Hardware enabled Watchdog options are available in order to achieve optimum trade-off between power consumption and noise immunity. For a complete description and a selection guide refer to page 33.

3.4 INTERRUPTS

The CPU can manage four Maskable and one Non-Maskable Interrupt source. Each source is associated with a specific Interrupt Vector. An internal pullup option on the NMI pin is available on ROM devices. For a complete description refer to page 37.

3.5 POWER SAVING MODES

WAIT mode reduces electrical consumption during idle periods, while STOP mode achieves the

lowest power consumption by stopping all CPU activity. For a complete description refer to page 41.

4 ON-CHIP PERIPHERALS

4.1 I/O PORTS

Input/Output lines may be individually programmed as one of a number of different configurations. For further details refer to page 43.

4.2 TIMER

The on-chip Timer peripheral consists of an 8-bit counter with a 7-bit programmable prescaler, giving a maximum count of 2^{15} . For a complete description refer to page 47.

4.3 A/D CONVERTER (ADC)

The 8-bit on-chip ADC features multiplexed analog inputs, as alternate I/O functions. Conversion is by successive approximations, with a typical conversion time of 70us, at 8MHz oscillator frequency. For a complete description refer to page 50.

5 SOFTWARE

5.1 ST6 ARCHITECTURE

The ST6 architecture has been designed to exploit the hardware in the most efficient way possible, while keeping byte usage to a minimum. For further details refer to page 52.

5.2 ADDRESSING MODES

The ST6 core offers nine addressing modes: Immediate, Direct, Short Direct, Extended, Program Counter Relative, Bit Direct, Bit Test & Branch, Indirect, and Inherent. For a complete description of the available addressing modes, refer to page 52.

5.3 INSTRUCTION SET

The ST6 core offers a set of 40 basic instructions which, when combined with nine addressing modes, yield 244 usable opcodes; these may be subdivided into six types: load/store, arithmetic/logic, conditional branch, control, jump/call, and bit manipulation. For further details refer to page 53.

6 ELECTRICAL CHARACTERISTICS

6.1 ABSOLUTE MAXIMUM RATINGS

This product contains devices designed to protect the inputs against damage due to high static voltages; however, it is advisable to take normal precautions to avoid applying voltages higher than the specified maximum ratings.

For proper operation, it is recommended that V_I and V_O be higher than V_{SS} and lower than V_{DD} . Reliability is enhanced if unused inputs are connected to an appropriate logic voltage level (V_{DD} or V_{SS}).

Power Considerations. The average chip-junction temperature, T_j , in degrees Celsius can be obtained from:

$$T_j = T_A + P_D \times R_{thJA}$$

Where:

T_A = Ambient Temperature.

R_{thJA} = Package thermal resistance (junction-to ambient).

$P_D = P_{int} + P_{port}$

$P_{int} = I_{DD} \times V_{DD}$ (chip internal power).

P_{port} = Port power dissipation (to be determined by the user)

Symbol	Parameter	Value	Unit
V_{DD}	Supply Voltage	-0.3 to 7.0	V
V_I	Input Voltage	$V_{SS} - 0.3$ to $V_{DD} + 0.3^{(1)}$	V
V_O	Output Voltage	$V_{SS} - 0.3$ to $V_{DD} + 0.3^{(1)}$	V
V_{PP}	OTP/EPROM Programming Voltage	13	V
I_O	Current Drain per Pin Excluding VDD, VSS	10	mA
I_{INJ+}	Pin Injection current (positive), All I/O, VDD = 4.5V	+5	mA
I_{INJ-}	Pin Injection current (negative), All I/O, VDD = 4.5V	-5	mA
I_{VDD}	Total Current into V_{DD} (source)	50 ⁽²⁾	mA
I_{VSS}	Total Current out of V_{SS} (sink)	50 ⁽²⁾	mA
T_j	Junction Temperature	150	°C
T_{STG}	Storage Temperature	-60 to 150	°C

Notes:

Stresses above those listed as "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

(1) Within these limits, clamping diodes are non-conducting. Voltages outside these limits are authorised provided injection current is kept within the specification.

(2) The total current through ports A and B combined may not exceed 50mA. The total current through port C combined may not exceed 50mA. If the application is designed with care and observing the limits stated above, total current may reach 100mA.

THERMAL CHARACTERISTIC

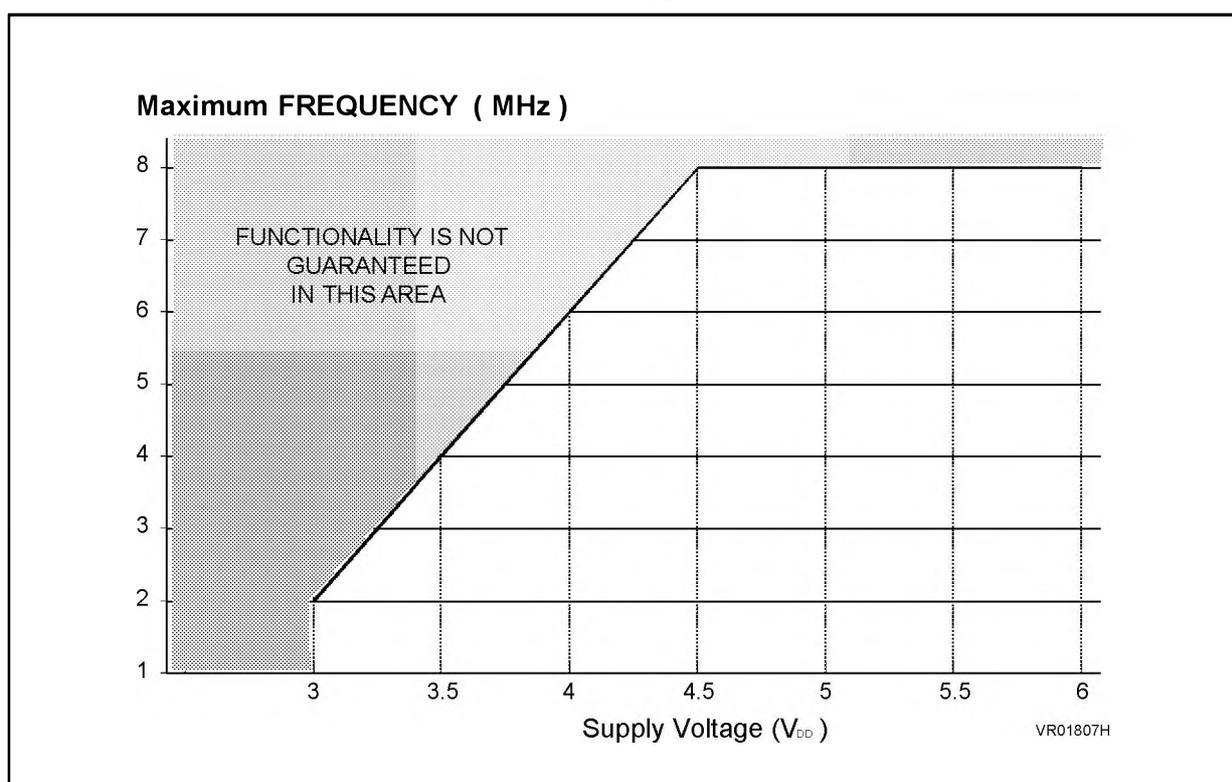

Symbol	Parameter	Test Condition s	Value			Unit
			Min.	Typ.	Max.	
RthJA	Thermal Resistance	PDIP20			60	
		PSO20			80	
		PDIP28			55	
		PSO28			75	

6.2 RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Test Conditions	Value			Unit
			Min.	Typ.	Max.	
T_A	Operating Temperature	6 Suffix Version 1 Suffix Version	-40 0		85 70	$^{\circ}\text{C}$
V_{DD}	Operating Supply Voltage		3.0V		6.0V	V
V_{PP}	Programming Voltage		12	12.5	13	V
I_{INJ+}	Pin Injection Current (positive) Digital Input Analog Inputs	$V_{DD} = 4.5$ to 5.5V			+5	mA
I_{INJ-}	Pin Injection Current (negative) Digital Input Analog Inputs	$V_{DD} = 4.5$ to 5.5V			-5	mA

Notes:

If a total current of +1mA is flowing into a single analog channel, or if the total current flowing into all the analog inputs is 1mA, all resulting A/D conversions will be shifted by + 1 LSB. If a total positive current is flowing into a single analog channel, or if the total current flowing into all analog inputs is 5mA, all the resulting conversions are shifted by + 2 LSB.

Figure 6. MAXIMUM OPERATING FREQUENCY (F_{MAX}) VERSUS SUPPLY VOLTAGE (V_{DD})

Note: The shaded area is outside the recommended operating range; device functionality is not guaranteed under these conditions.
